FISSION CROSS SECTIONS FROM POMMARD

by

P. A. Seeger

ABSTRACT

Neutron-induced fission cross sections measured by Los Alamos Scientific Laboratory Groups P-3 and W-8 on the Pommard event of March 15, 1968, are plotted and given in numerical tables. The isotopes ^{232}U, ^{233}U, ^{235}U, ^{236}U, ^{237}U, ^{238}Pu, ^{242}Pu, ^{243}Am, and ^{243}Cm are included. The names of the authors to be referenced are given with each isotope. This report is not to be used as a reference without the permission of the individual workers.

I. INTRODUCTION

The experimental arrangement and data-reduction programs have been described[1,2,3] in previous laboratory reports and publications, and will not be repeated here. The flight path for Pommard was 214.43 m and recordings were made with resolutions of 0.2 and 1 μsec.

A malfunction of every amplifier at 50 μsec after the burst, presumably triggered by electromagnetic noise, caused a calibration signal to be overwritten on every signal. For most amplifiers, there apparently was also a shift in the operating point of the amplifier input stage that led to considerable uncertainty in the base lines following this "catastrophe." Essentially all data from 100 keV to about 10 keV (the lower limit being different for each signal) were lost.

Backgrounds were measured by detectors viewing blank stainless steel target backings. Only the high-energy, high-resolution background recordings were used because the base-line uncertainty at low energies was greater than the signals. Figure 1 shows the four backgrounds, 55 and 90° in each of the two neutron beams used, which have been normalized to a standard solid angle of 0.2816 sr.

Flux at high energies was taken from a single recording from a ^{235}U foil, referenced to the $\sigma_{n,f}$ cross-section evaluation of Davey.[4] Table I gives the values used for the 55° cross section. The

TABLE I

REFERENCE CROSS SECTION, ^{235}U

E (MeV)	σ (barn)
3.01	1.18
2.73	1.21
2.47	1.26
2.23	1.31
2.02	1.31
1.83	1.28
1.65	1.25
1.50	1.23
1.35	1.22
1.22	1.22
1.11	1.22

0.907	1.21
0.821	1.18
0.783	1.15
0.672	1.13

other three signals were either lost or were too faint on film to read accurately. From 1 keV down, an average of three readings of a 55° signal and one reading of a 90° signal on ^{6}Li was used, taking the $^{6}Li(n,\alpha t)$ cross section to have 1/v dependence, with a value 940.3 ± 1.6 b at 2200 m/sec. From 35 eV to 10 eV, the ^{6}Li signal was too small to be reliable. Integrals over ^{235}U fission resonances were compared to a recent measurement[5] so as to normalize the flux. Interpolation between 100 keV and 1 keV was by comparison to previous experiments (see Figs. 2 and 3 of Ref. 2). The Pommard flux is shown in Fig. 2. The correlated or systematic uncertainty in this flux determination is ±2.9% in the low-energy region and ±4.8% in the high-energy region.

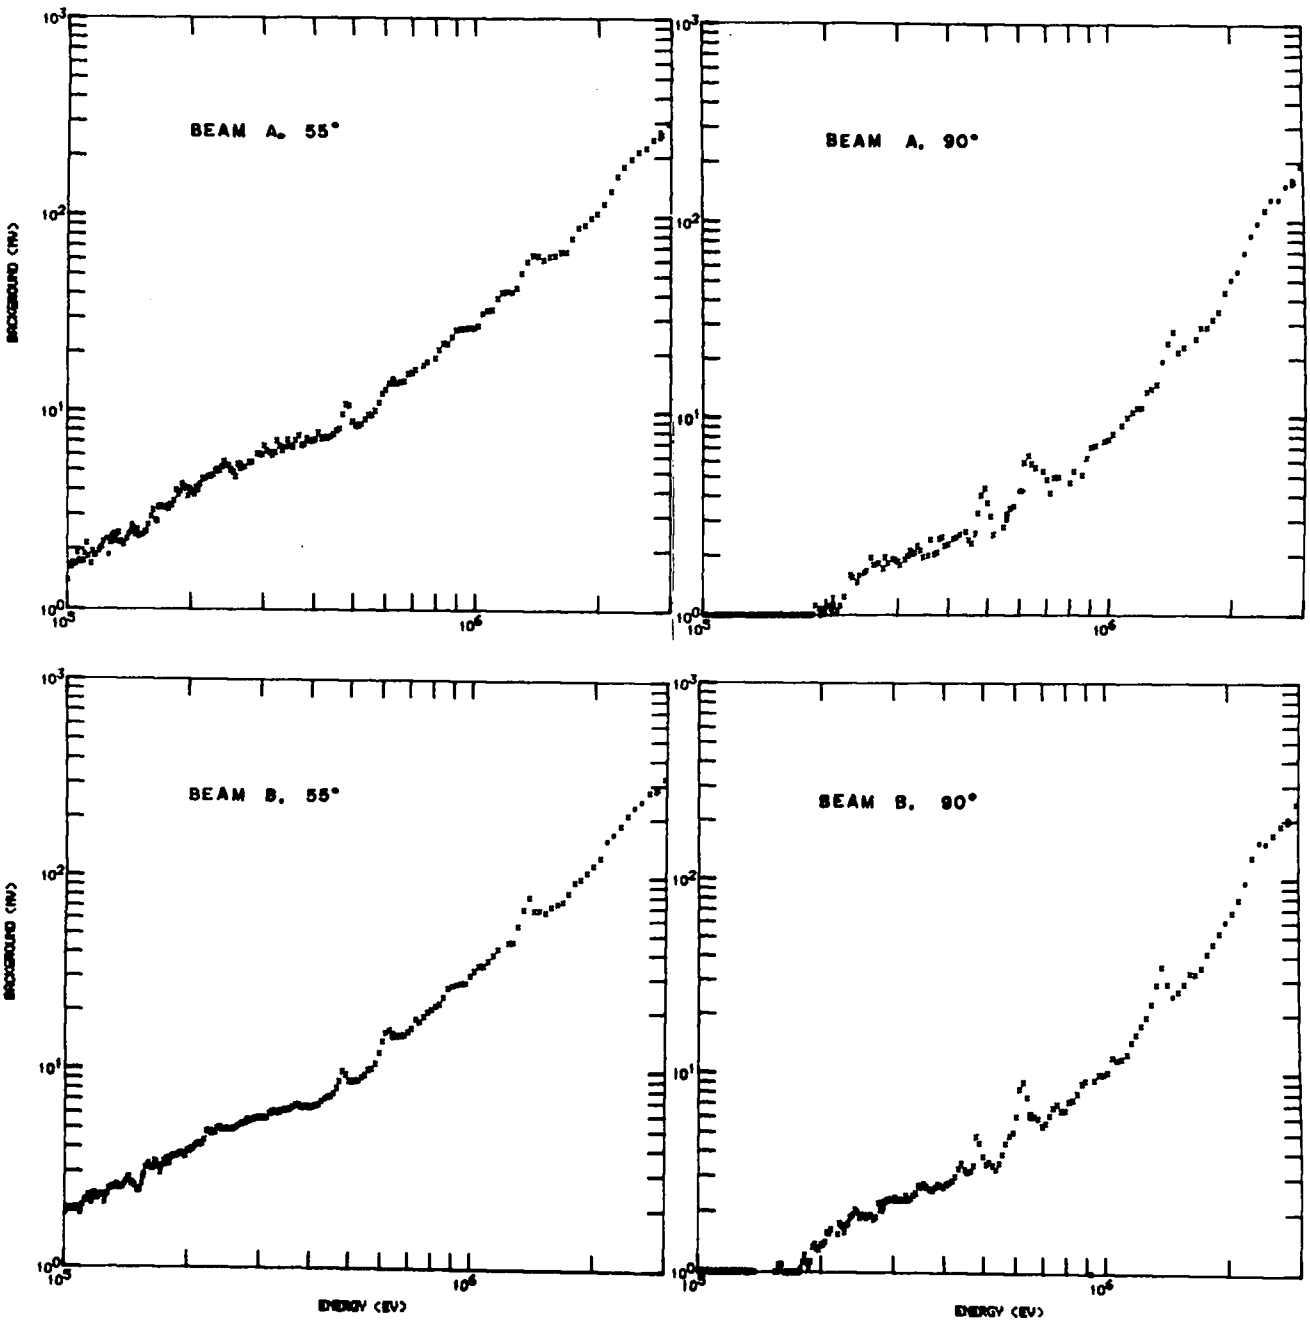

Fig. 1. High-energy background signals for Pommard; 55 and 90° detectors in two neutron beams.

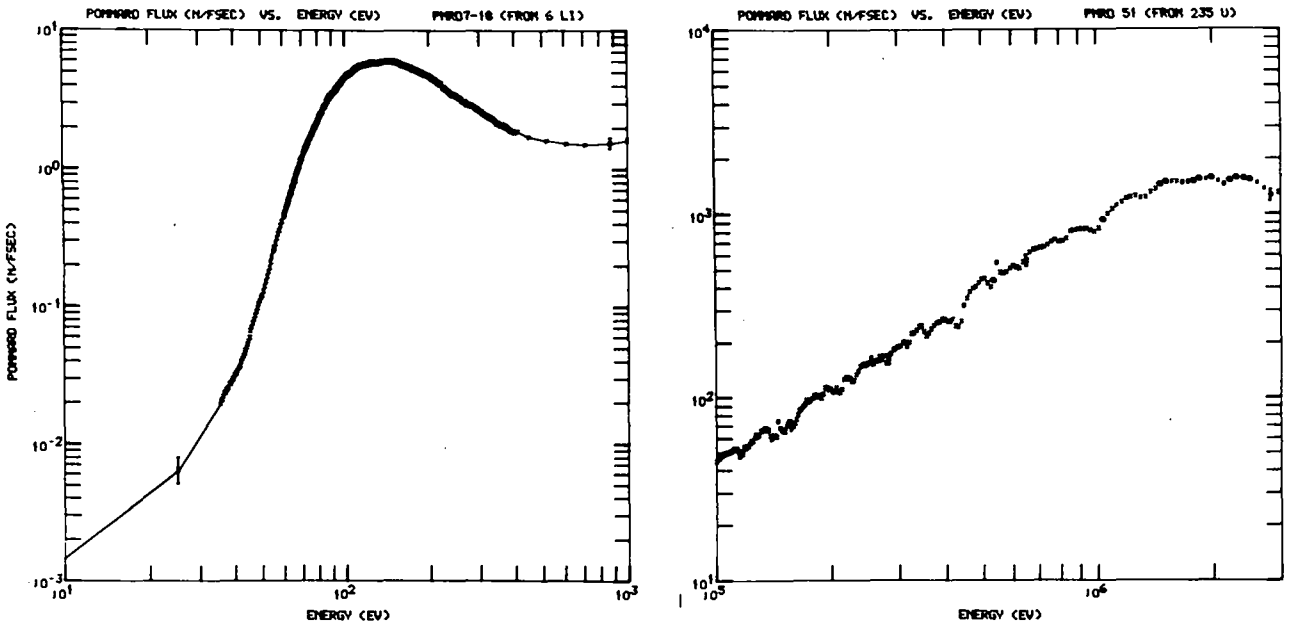

Fig. 2. Pommard flux. Low energy by comparison to $^{6}Li(n,\alpha t)$: high energy from $^{235}U(n,f)$.

II. ^{232}U: J. A. Farrell[6]

All high-resolution (high-energy) recordings were lost.

One manual (projection microscope) and two automatic (programmed oscilloscope light source) readings of one recorded signal are averaged. A very small base line correction, lowering the signals by 3 μm on the film, or equivalently subtracting 0.09 mV, was made by observing the shape of the signal from 50 to 70 eV. Target density was not measured: therefore the result was normalized to 1000 b at the peak of the 75 eV resonance.[7] In Fig. 3, the three readings are plotted and the average is indicated by a line connecting points, from 10 eV to 30 keV. The data are also given in Table II as is the standard deviation $\delta\sigma/\sigma$ assigned to each point. These errors include a systematic uncertainty of ±6.0%.

No correction has been made for resolution or for target impurities.

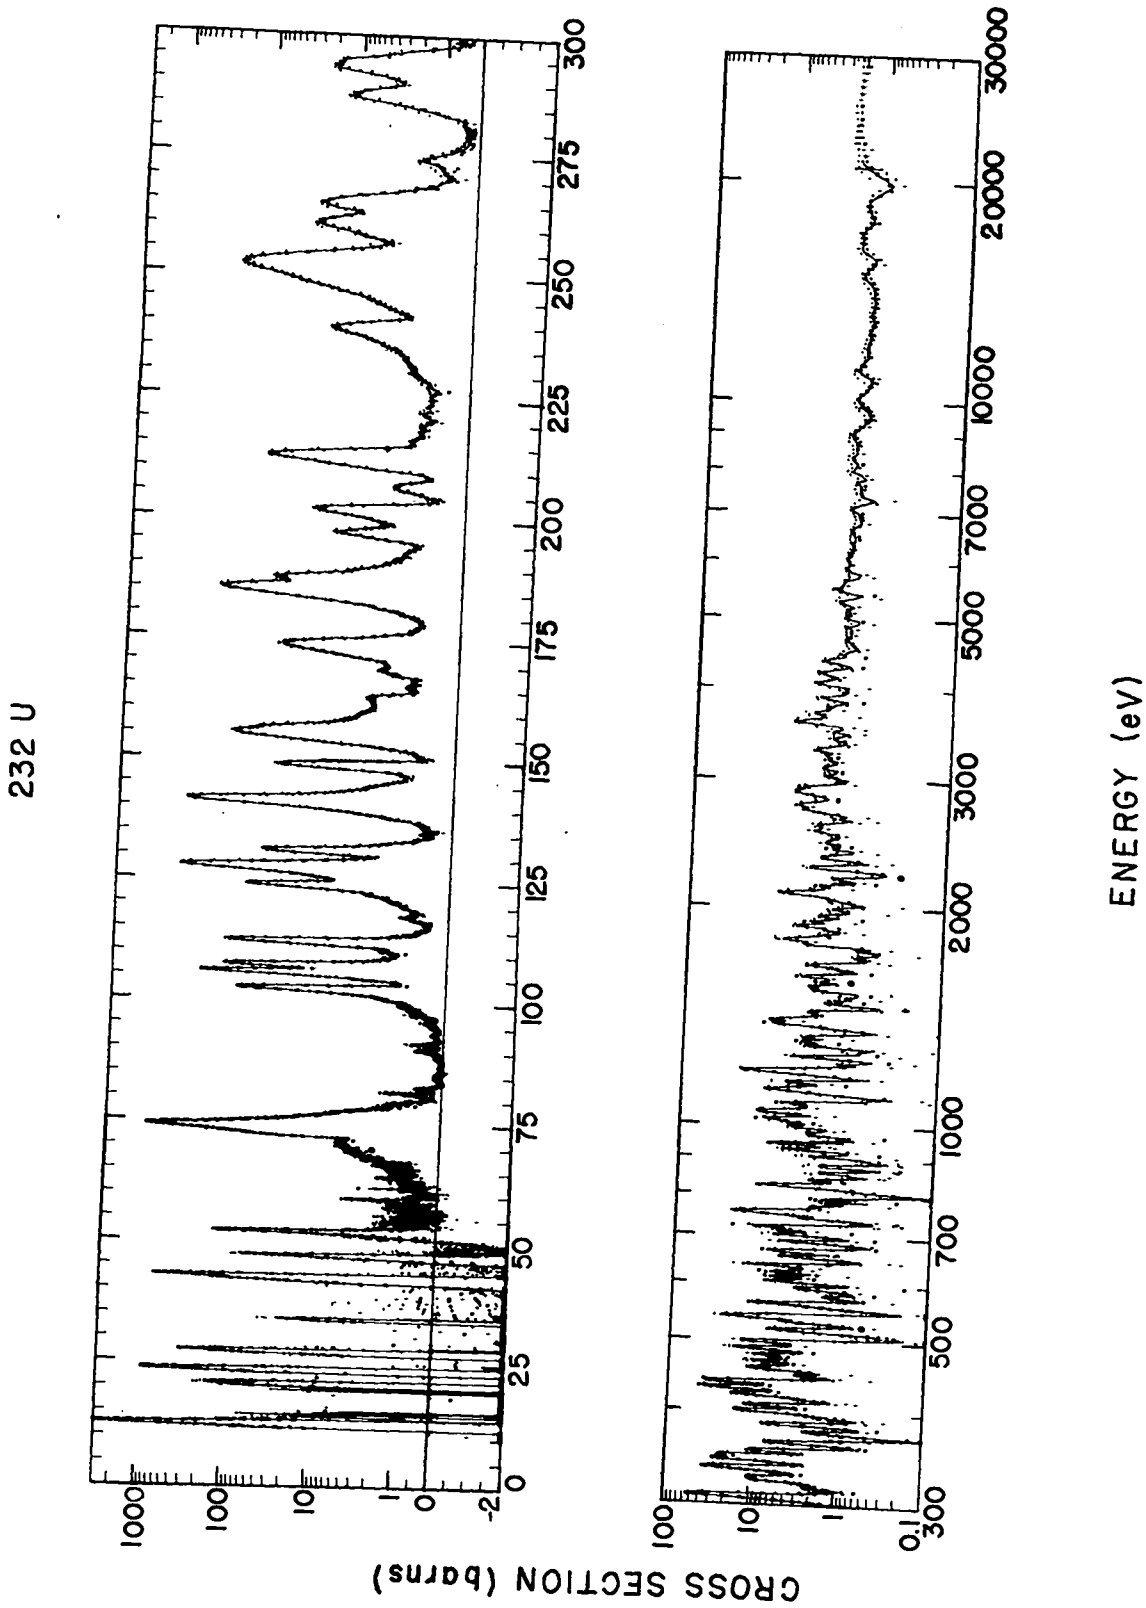

Fig. 3. Fission cross section of ^{232}U. The line is the average of three readings of one signal.

III. ^{233}U: D. W. Bergen[8]

The low-energy data are a weighted average of six readings; two each of three signals at 15, 55, and 90°. Base line following the catastrophe was taken to be the same as step 0 of the post-signal calibration signal with no arbitrary shifts. The high-energy data shown in Fig. 4 are the average of two readings of the 55° high-resolution recording with two readings of the 90° high-resolution recording. Figures 5 and 6 show the averages of the readings at each angle, with a line drawn through the overall average, over the ranges 10 to 200 eV and 200 to 5000 eV. The 15° data were not included in the average above 1000 eV. The average data are listed in Table III. The standard deviations ($\delta\sigma/\sigma$) include the correlated errors, which are ±5.7% above 64 keV and ±4.1% below 10 keV.

No correction has been made for target contaminants (2.9% ^{235}U) or for source-resolution function.

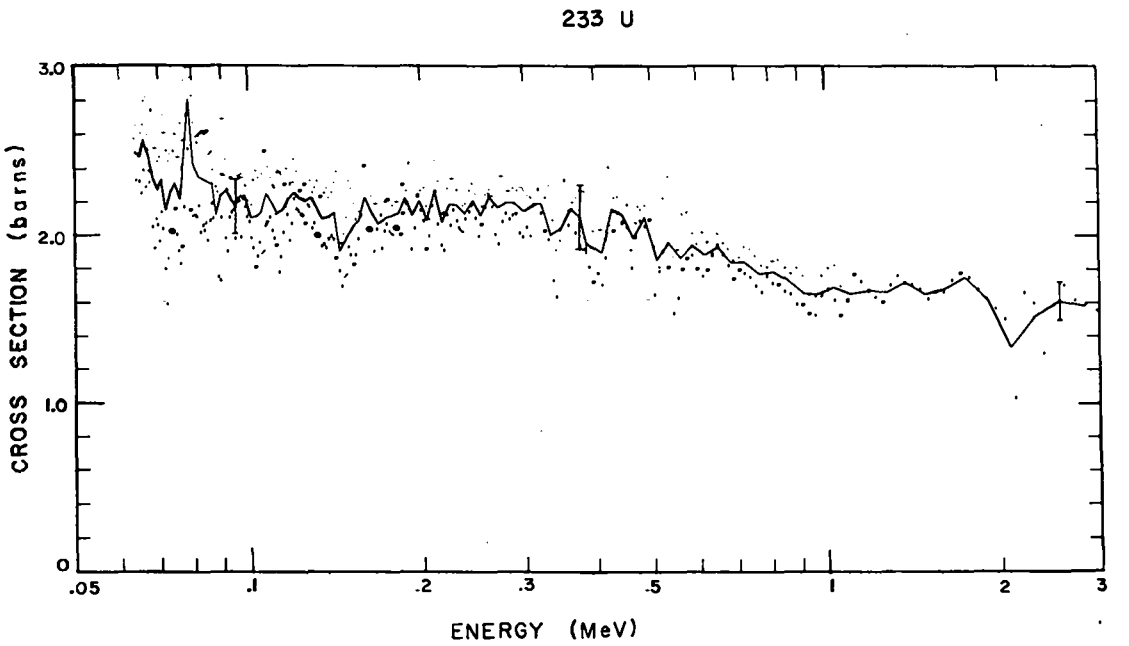

Fig. 4. Fission cross section of ^{233}U. The line is the average of two high-resolution signals records. (55 and 90°).

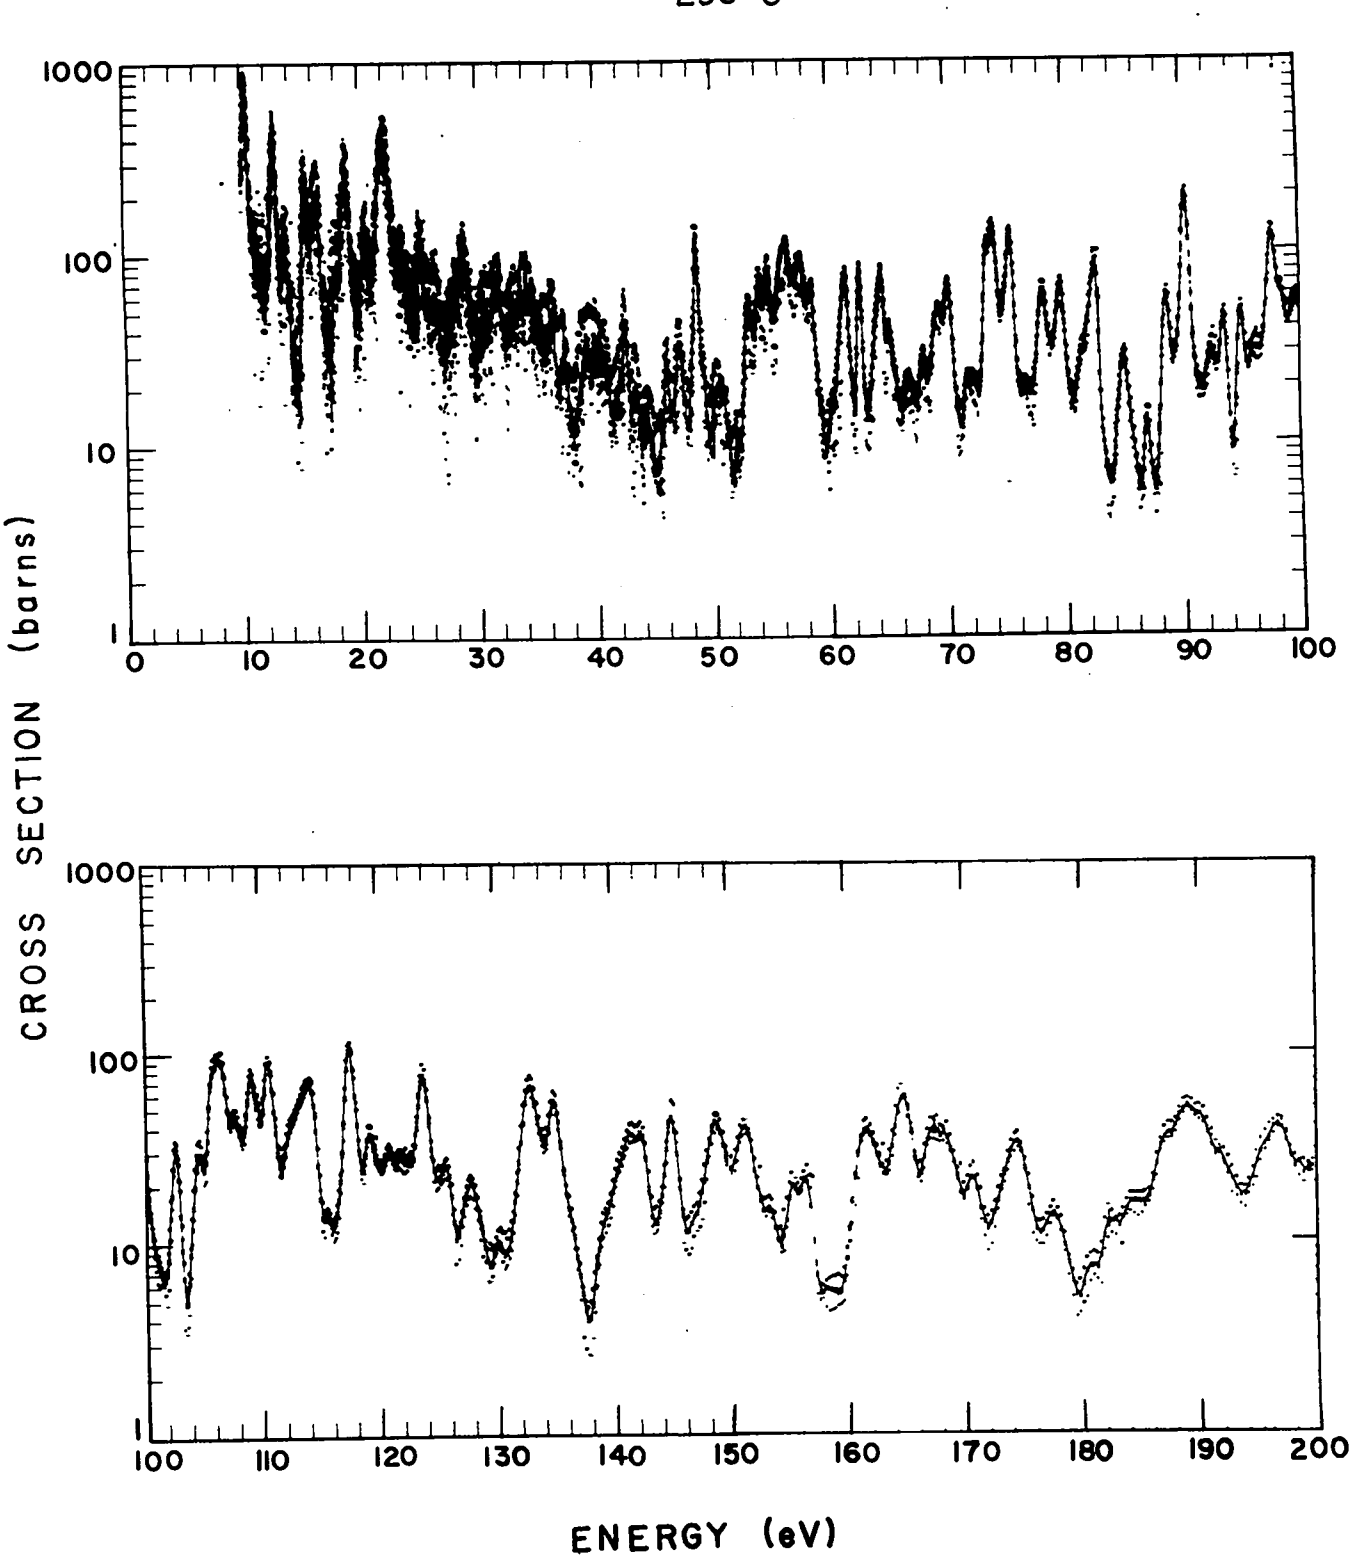

Fig. 5. Fission cross section of ^{233}U. The line is the average of signals at 15, 55, and 90°.

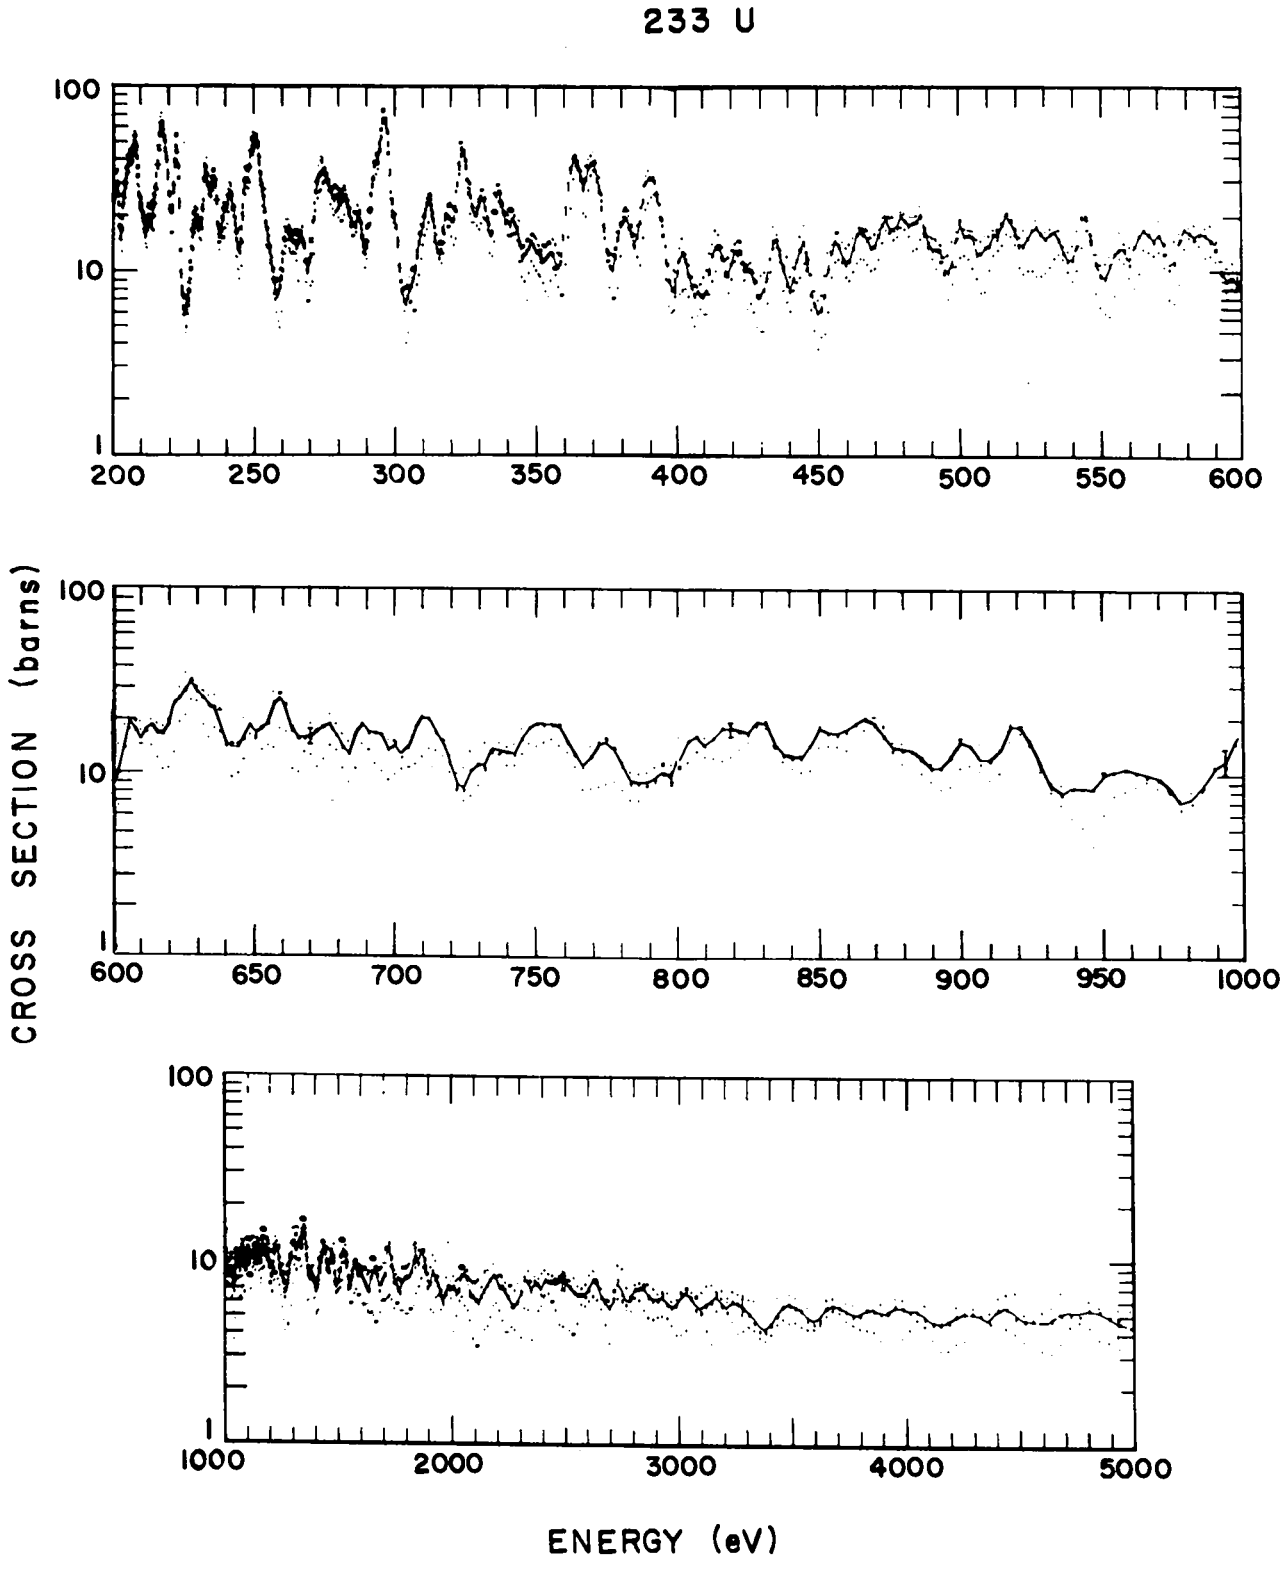

Fig. 6. Fission cross section of ^{233}U. The line is the average of signals at 15, 55, and 90°.

IV. ^{235}U: J. D. Cramer[9]

In Fig. 7, the same high-resolution signal used to determine the flux is plotted in terms of cross section. Signals were successfully recorded at low resolution from detectors at 55 and 90° on ^{235}U targets in both neutron beams, and two readings were made of each recording. The averages of the readings for each detector are plotted in Figs. 8 and 9, with the overall average indicated by a line. Because the beam A amplifiers recovered less quickly after the catastrophe, those readings are not included in the average above 2000 eV. The correlated error below 10 keV is ±4.5%. The average data are listed in Table IV and selected integrals are compared to the ORNL-RPI data[5] in Table V. Note that the Pommard results appear to be 15% high from 60 eV to 1 keV.

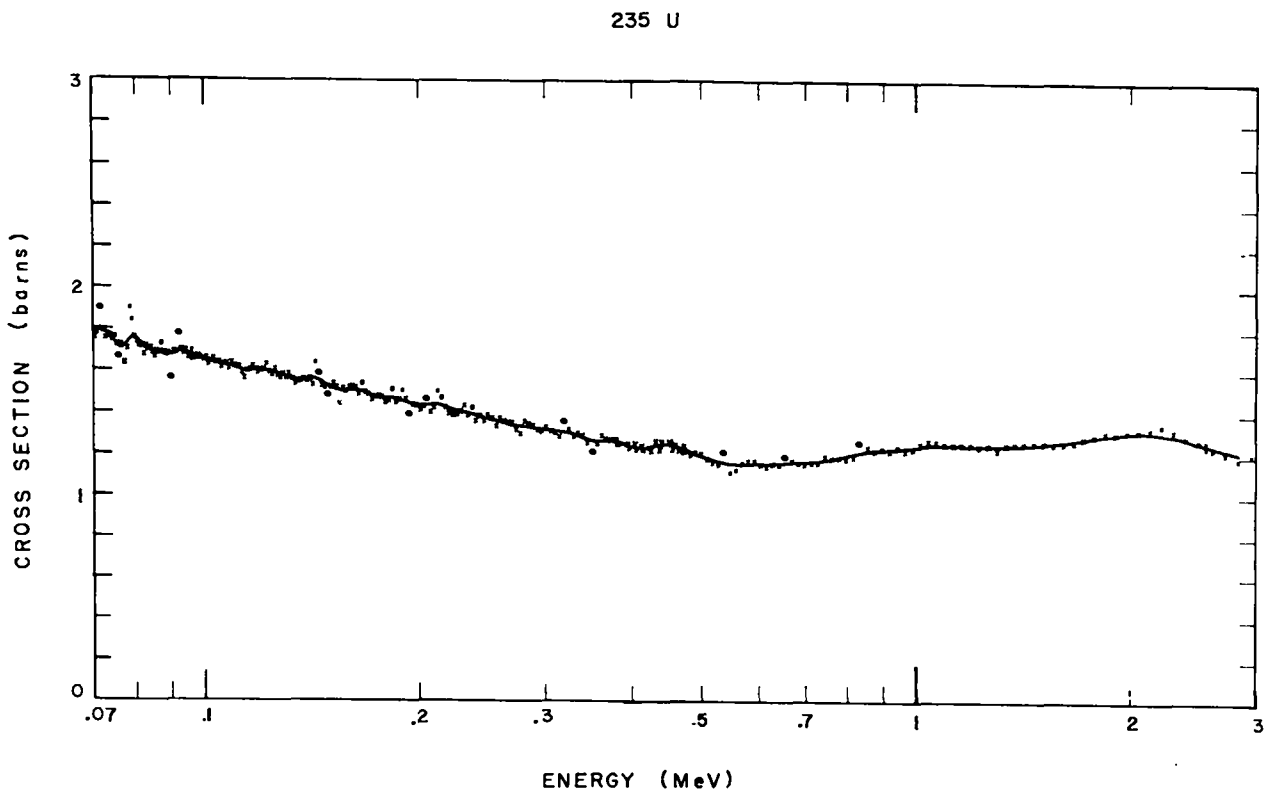

Fig. 7. Fission cross section of ^{235}U. Self-normalized to the evaluation of Davey (Ref. 4).

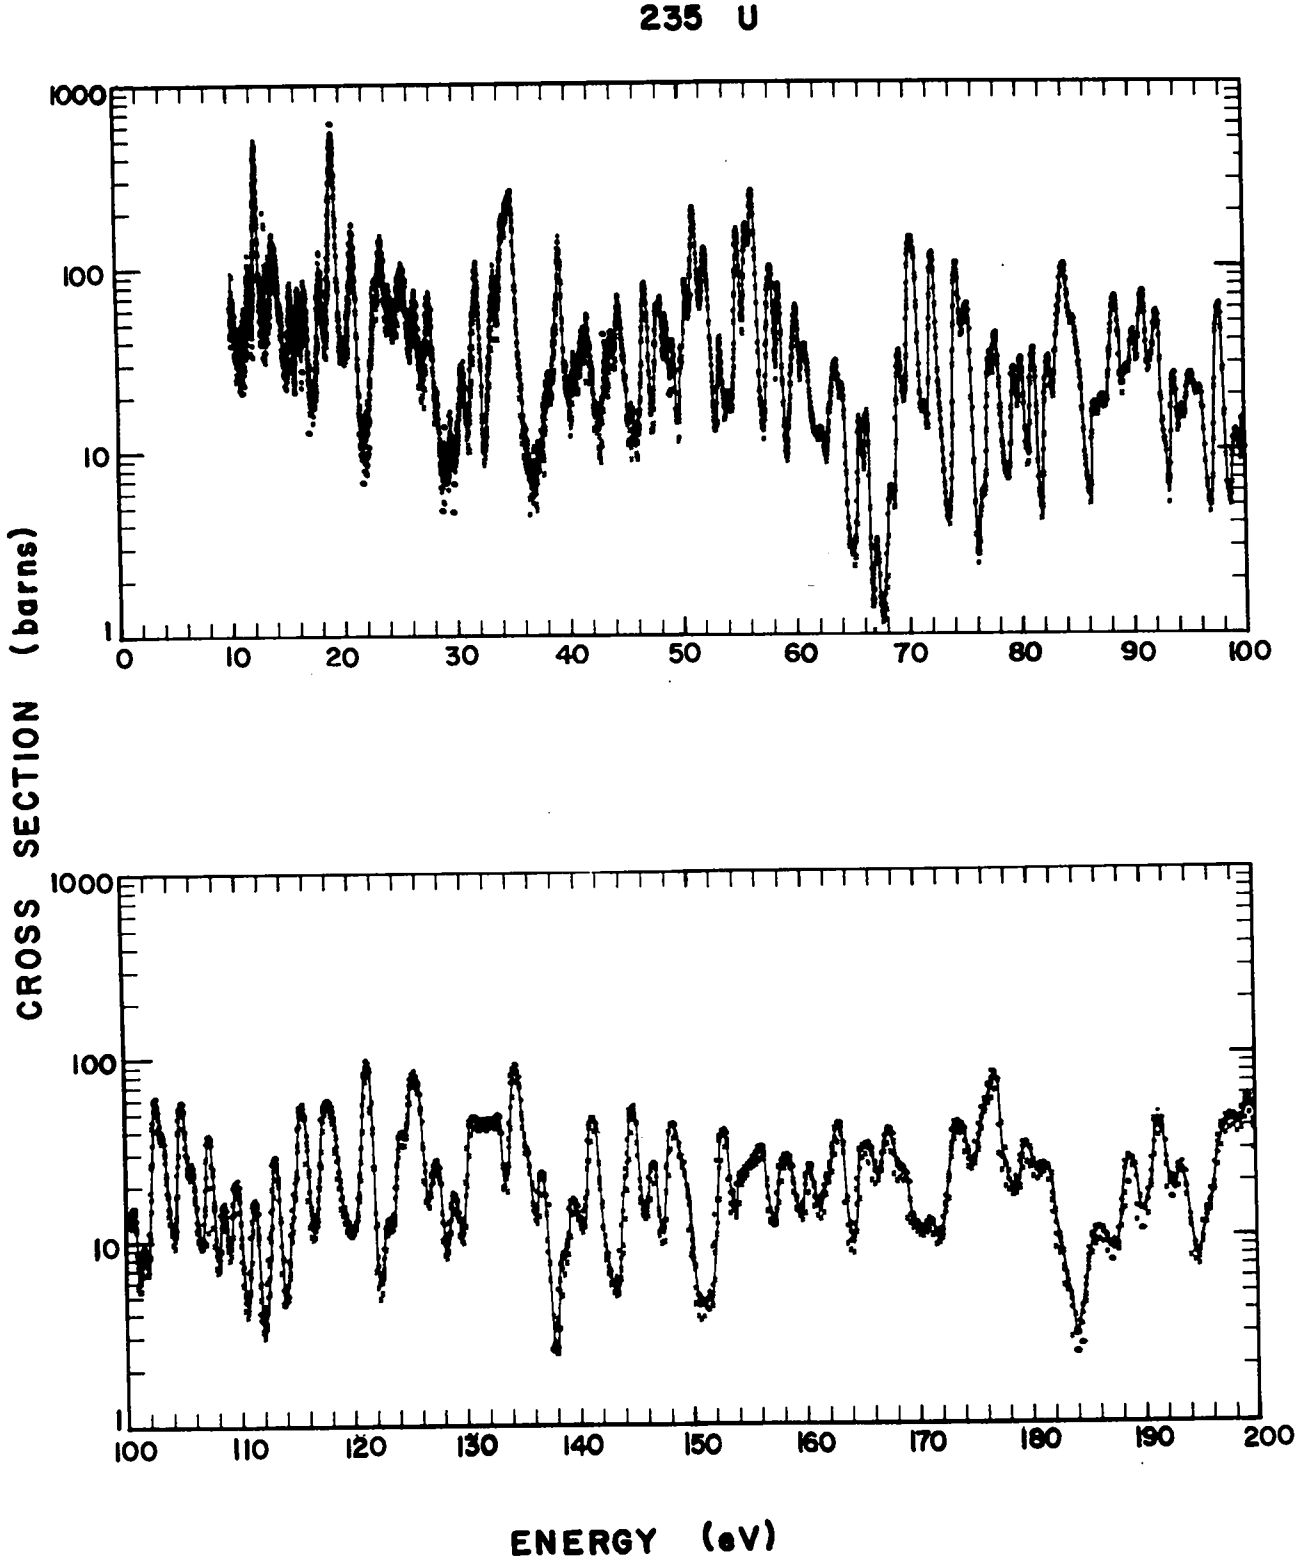

Fig. 8. Fission cross section of ^{235}U. Average from two targets (x beam A, * beam B); points are plotted for 55 and 90° detectors in each beam.

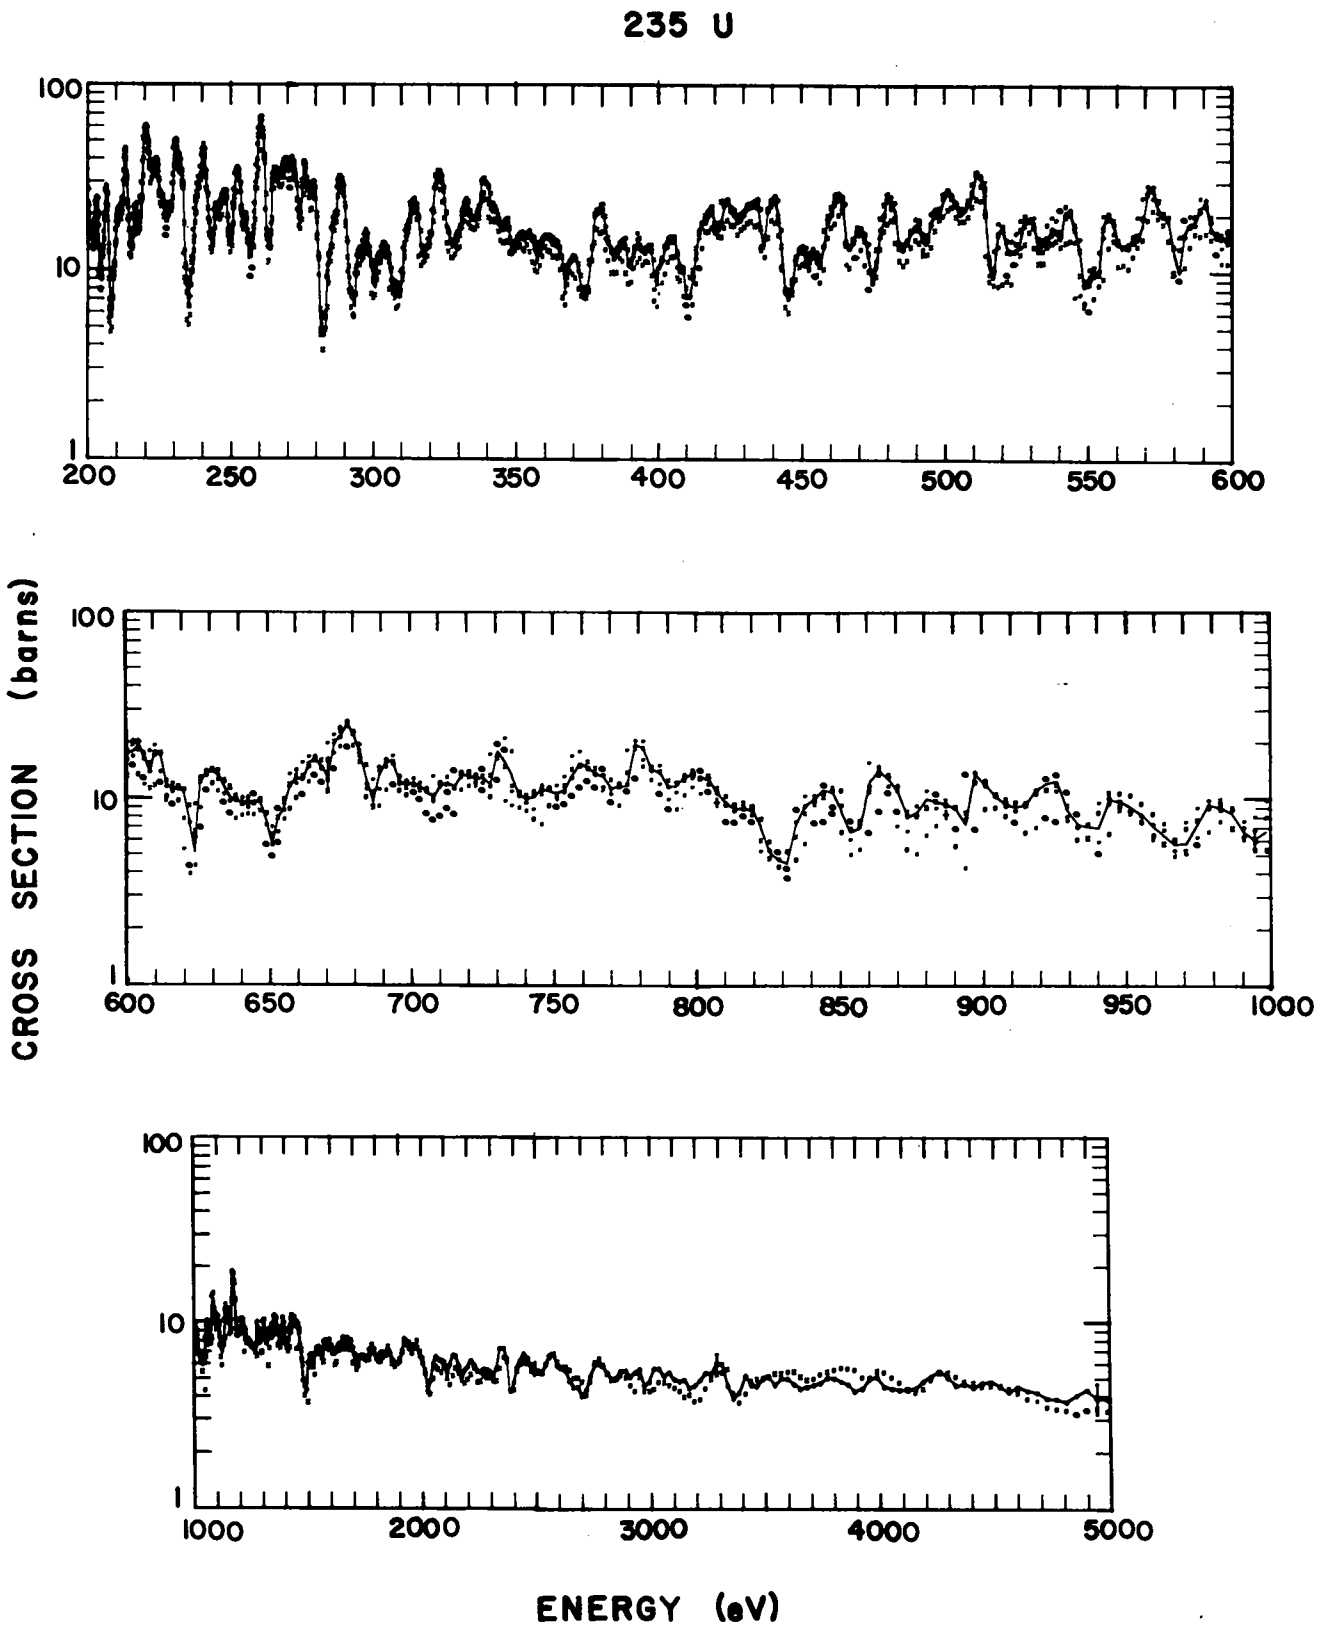

Fig. 9. Fission cross section of ^{235}U. Average from two targets (x beam A, * beam B); above 2 keV only beam B is included in average.

TABLE IV

FISSION CROSS SECTION OF ^{235}U (J. D. CRAMER[9])

V. ^{236}U: J. D. Cramer and D. W. Bergen[10]

In Fig. 10, the average of two readings of the 55° signal and the average of two readings of the 90° signal are plotted as points with the overall average indicated by a line. Figure 11 shows a similar average of the low-resolution recordings. The 55° result above threshold appears to be greater than the 90° result by about nine times the calculated standard deviation of ±4.0% for the systematic difference of the two recordings. Neither amplifier showed base line shift or other instability that could account for such a discrepancy (about 50 μm on the film). The average data and standard deviations are given in Table VI. The correlated errors are included in δσ/σ, and are ±6.1% above 100 keV and ±4.8% below 2 keV. Note that no correction has been made for the 0.15% ^{235}U content of the target, nor for the γ-ray sensitivity of the fission detectors; thus, no structure can be unequivocally identified as fission.

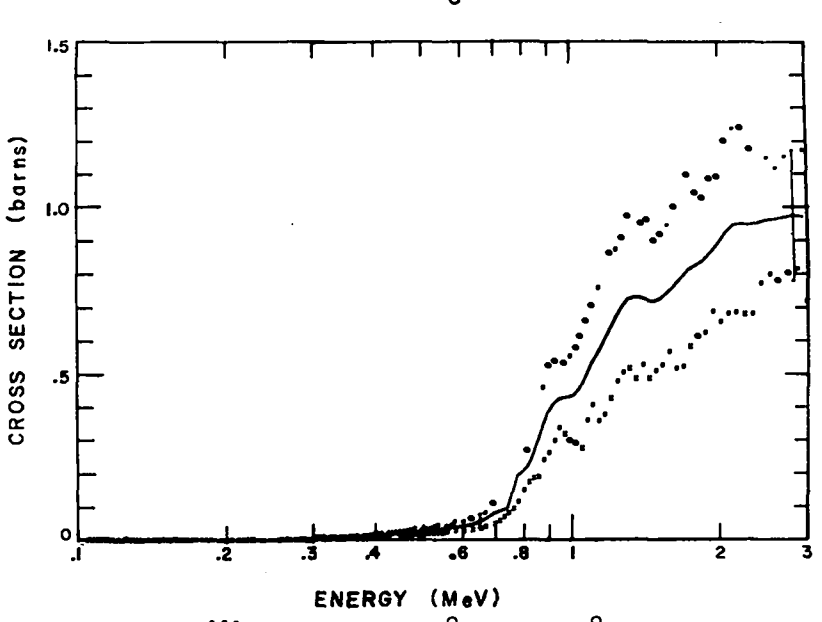

Fig. 10. Fission cross section of ^{236}U. Average of 55° (*) and 90° (x) data. Cause of discrepancy unknown.

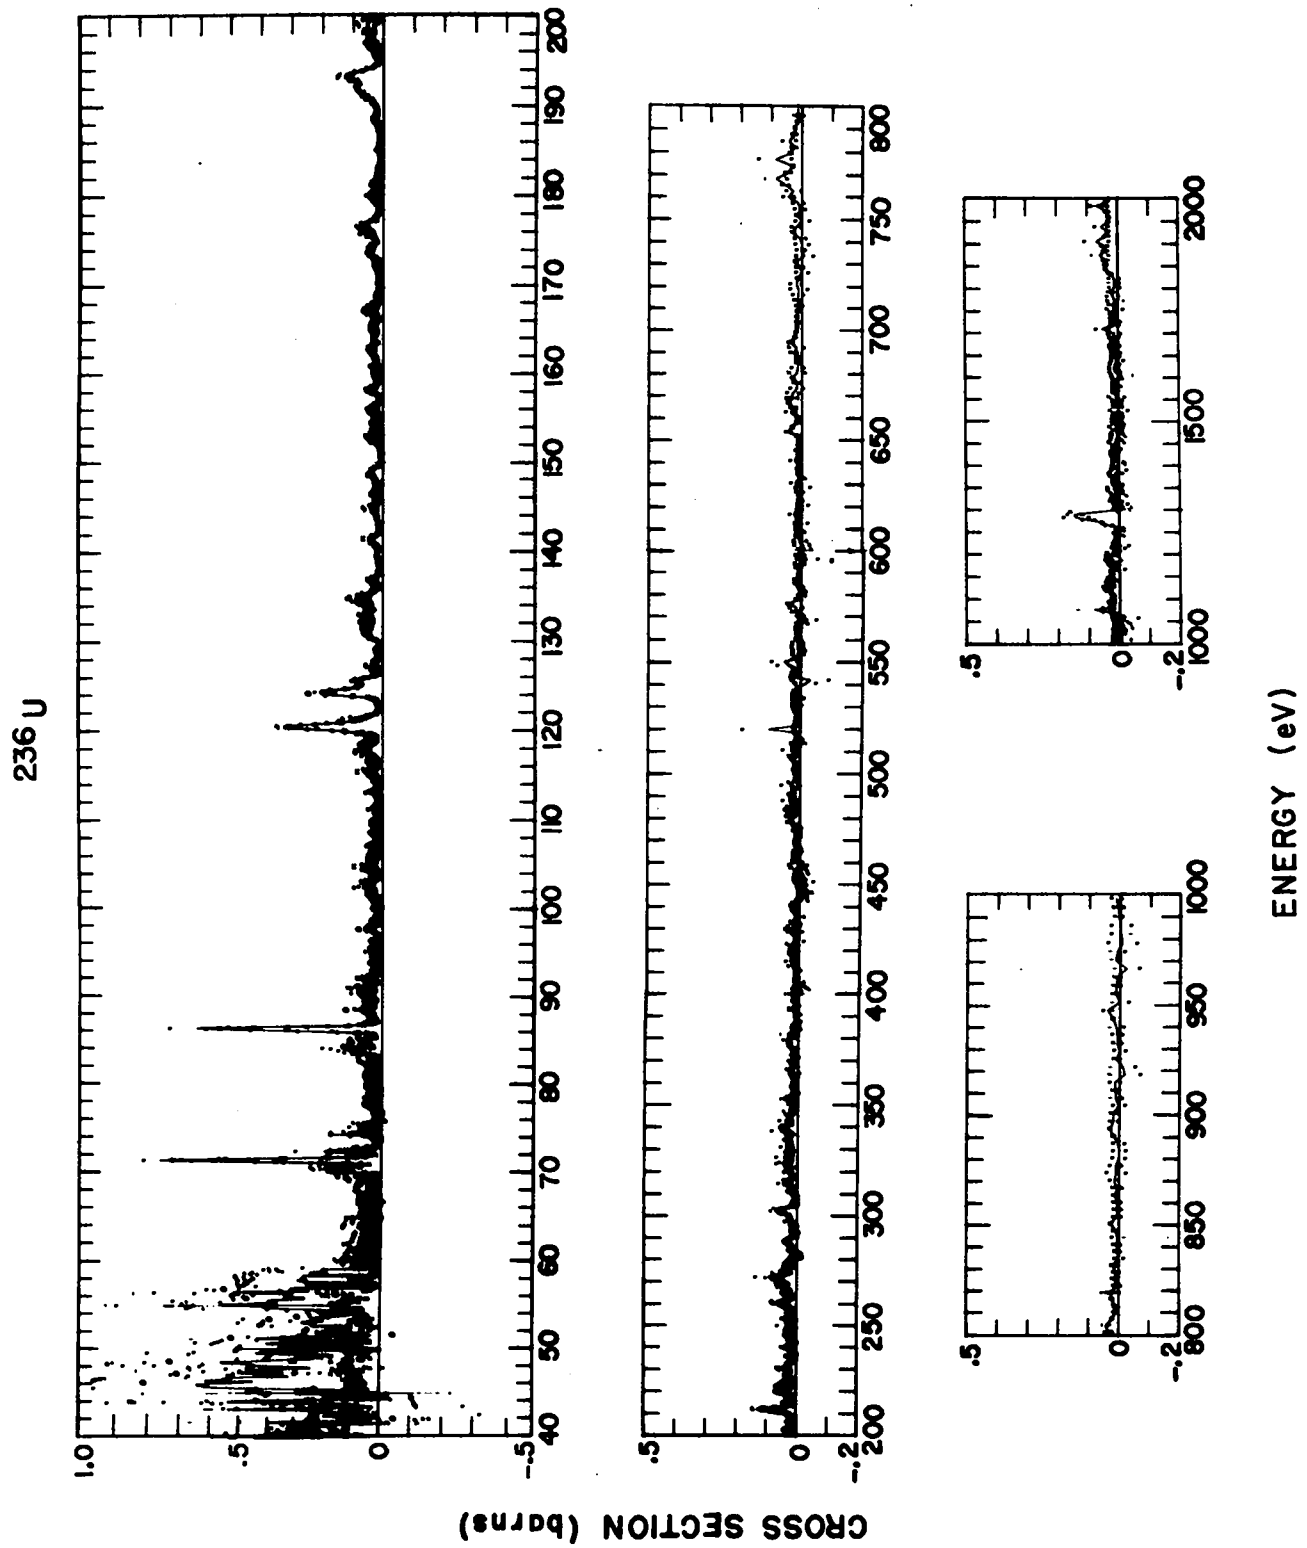

Fig. 11. Fission cross section of ^{236}U. Average of 55° (*) and 90° (x) data. Not corrected for γ-ray sensitivity of detectors.

VI. ^{237}U: J. H. McNally, J. W. Barnes, B. J. Dropesky, P. A. Seeger, and K. Wolfsberg[11]

The sample contained 18.1 ± 0.5 μg of ^{237}U at shot time, or about 1% of the customary target density. There was a 38% contaminant of ^{237}Np (daughter product of ^{237}U β-decay, $T_{\frac{1}{2}}$ = 6.75 days) which was negligible in the low-energy region and has been subtracted above 100 keV on the basis of a simultaneous measurement on a ^{237}Np target.[12] High-resolution recordings of two signals were averaged above 100 keV. The line in Fig. 12 is the average result after subtracting ^{237}Np. For the low-energy data (Fig. 13) the line is a smooth curve drawn through the average of two readings of one signal (90°). At 560 eV the two readings disagreed and only one was used. An arbitrary base line shift of -0.06 ± 0.03 mV has been applied to bring the level to about zero near 60 eV. The data are listed in Table VII. Standard deviations $\delta\sigma/\sigma$ include the correlated or systematic uncertainty of ±6.0%.

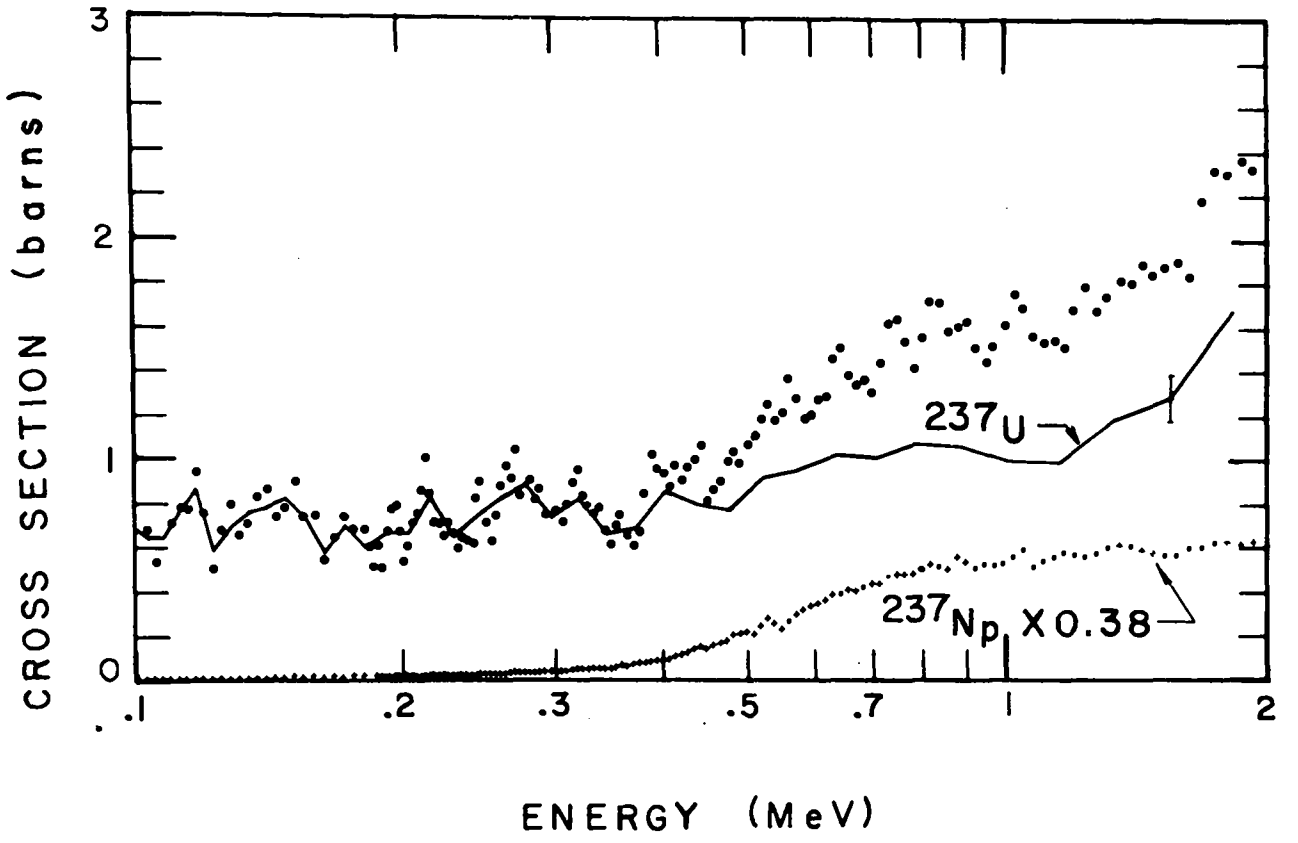

Fig. 12. Fission cross section of ^{237}U; data corrected for ^{237}Np content of target.

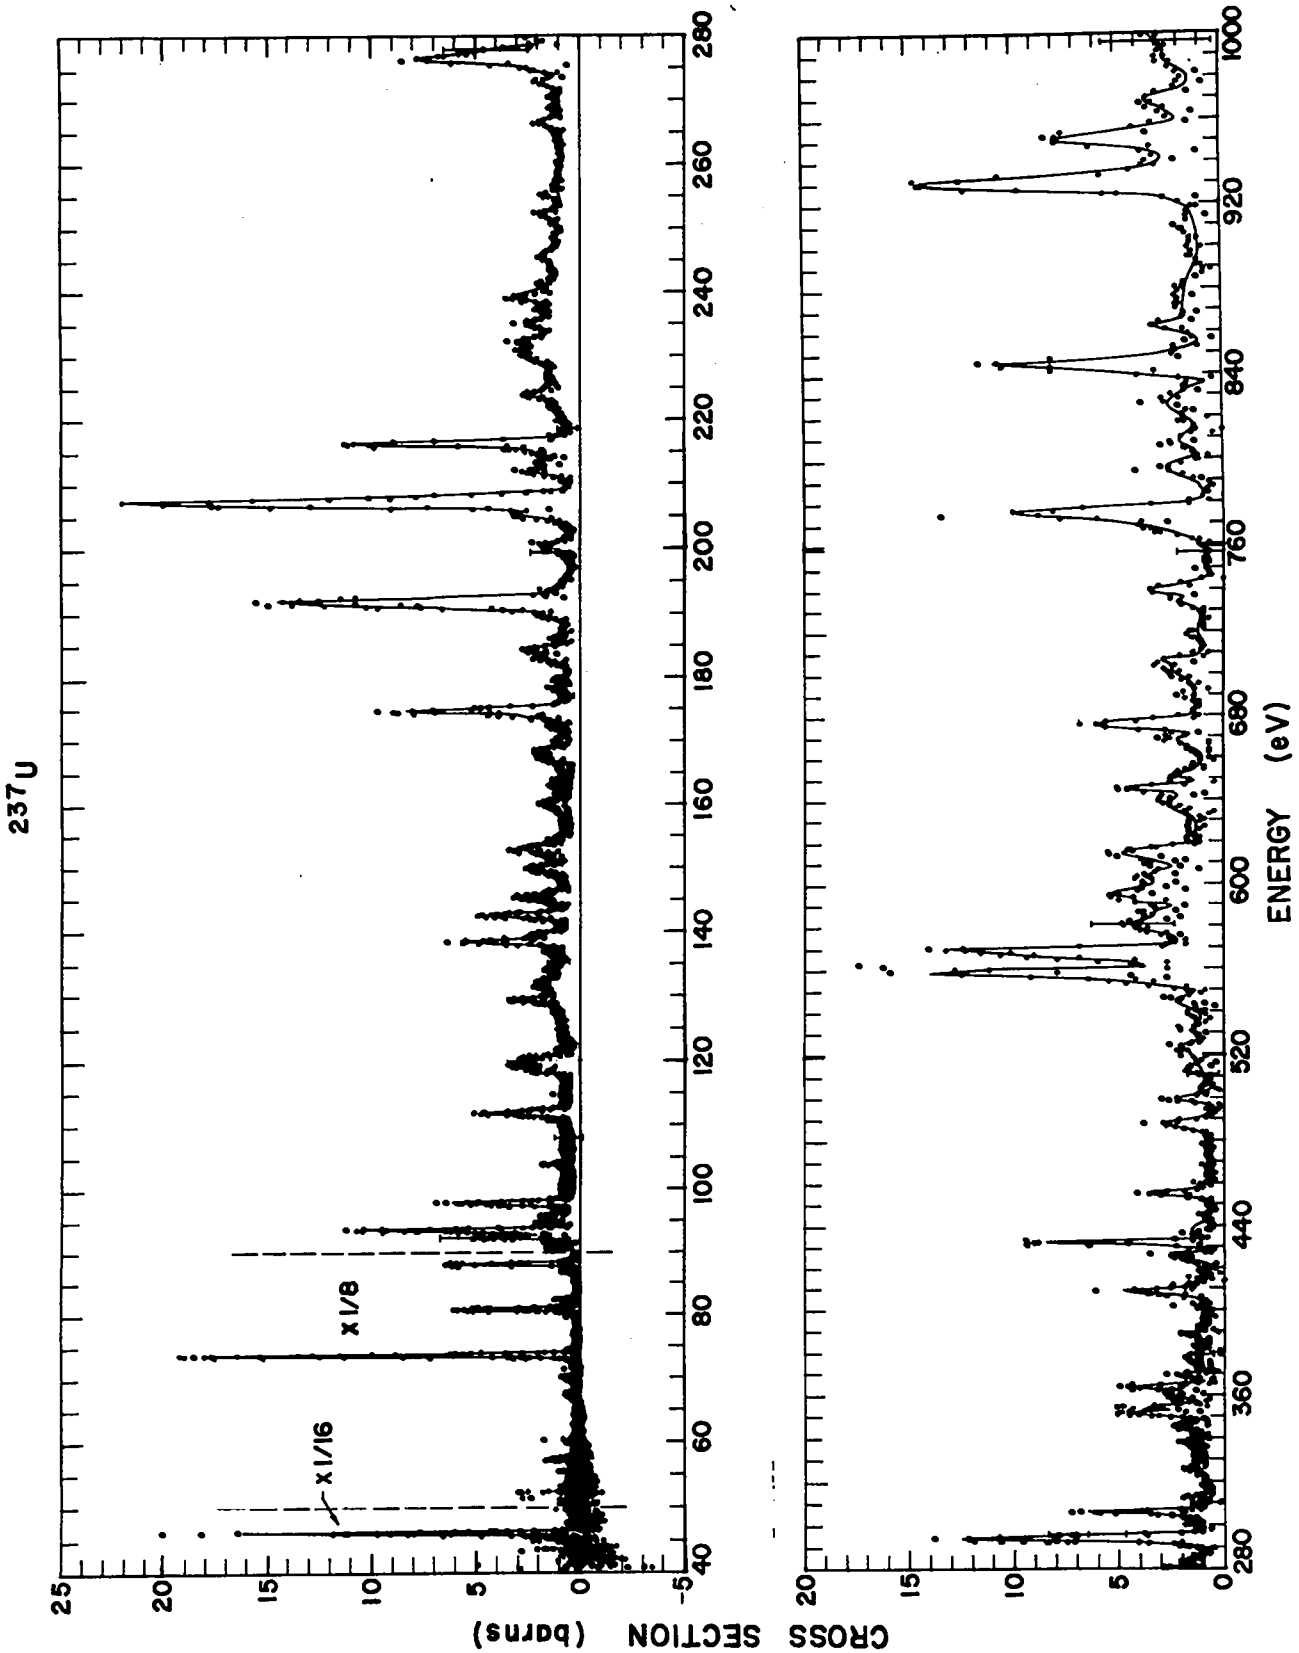

Fig. 13. Fission cross section of ^{237}U.

TABLE VII

FISSION CROSS SECTION OF ^{237}U (J. H. McNALLY, J. W. BARNES, B. J. DROPESKY, P. A. SEEGER, AND K. WOLFSBERG[11])

VII. ^{238}Pu: D. M. Drake, C. D. Bowman, M. S. Coops, and R. W. Hoff[13]

The cross section near threshold, determined from a high-resolution recording of the 55° signal, is plotted in Fig. 14. The line is a computer-drawn "curve-to-guide-the-eye" generated by taking a Gaussian-weighted running average of standard deviation 0.2 μsec every 0.2 μsec, and connecting those points with cubic segments by 4-point progressive interpolation.

One reading of each angle (55° data denoted by x, 90° data by *) is plotted in Figs. 15 and 16, with a line drawn through the average. A shift of -0.10 mV has been made in the 90° signal, but this is not significant above about 60 eV. The data are listed in Table VIII. The correlated error (included in δσ/σ) is ±6.5% above 100 keV and ±4.7% below 10 keV. No corrections have been made for target impurities or for source resolution function.

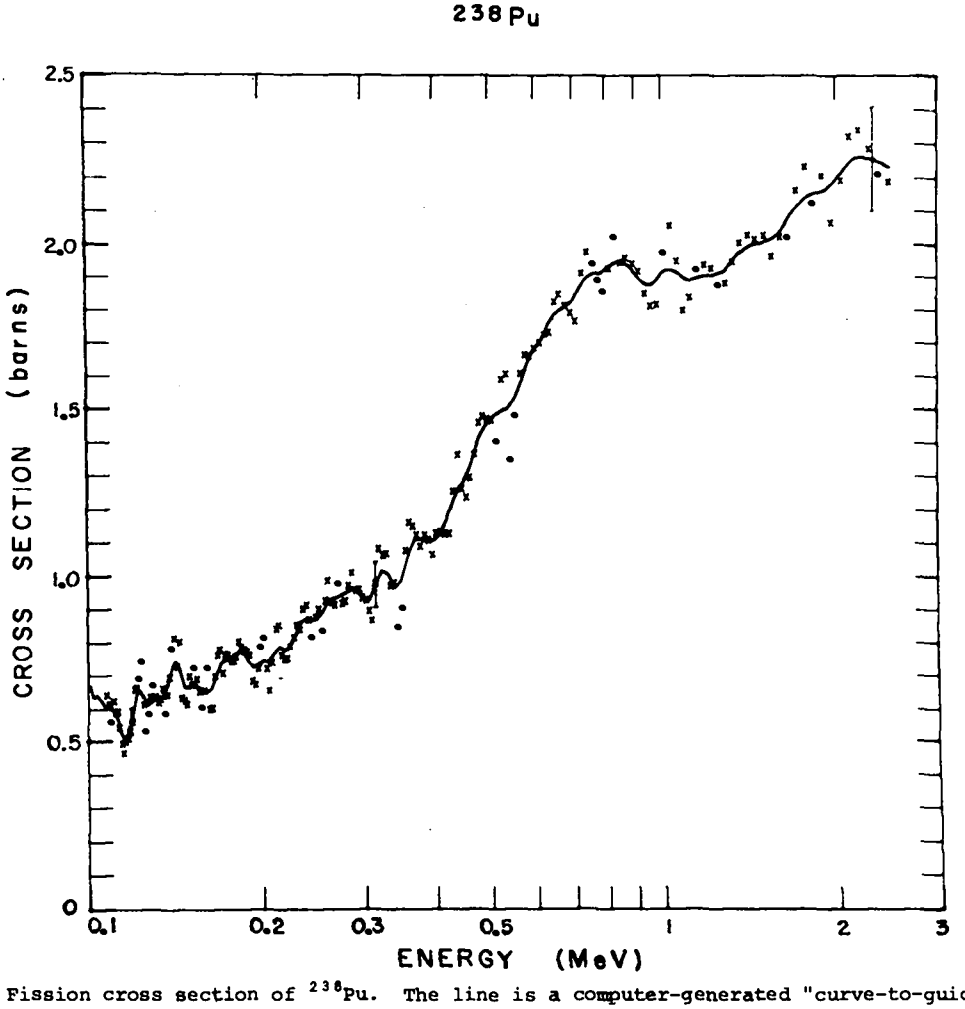

Fig. 14. Fission cross section of ^{238}Pu. The line is a computer-generated "curve-to-guide-the-eye."

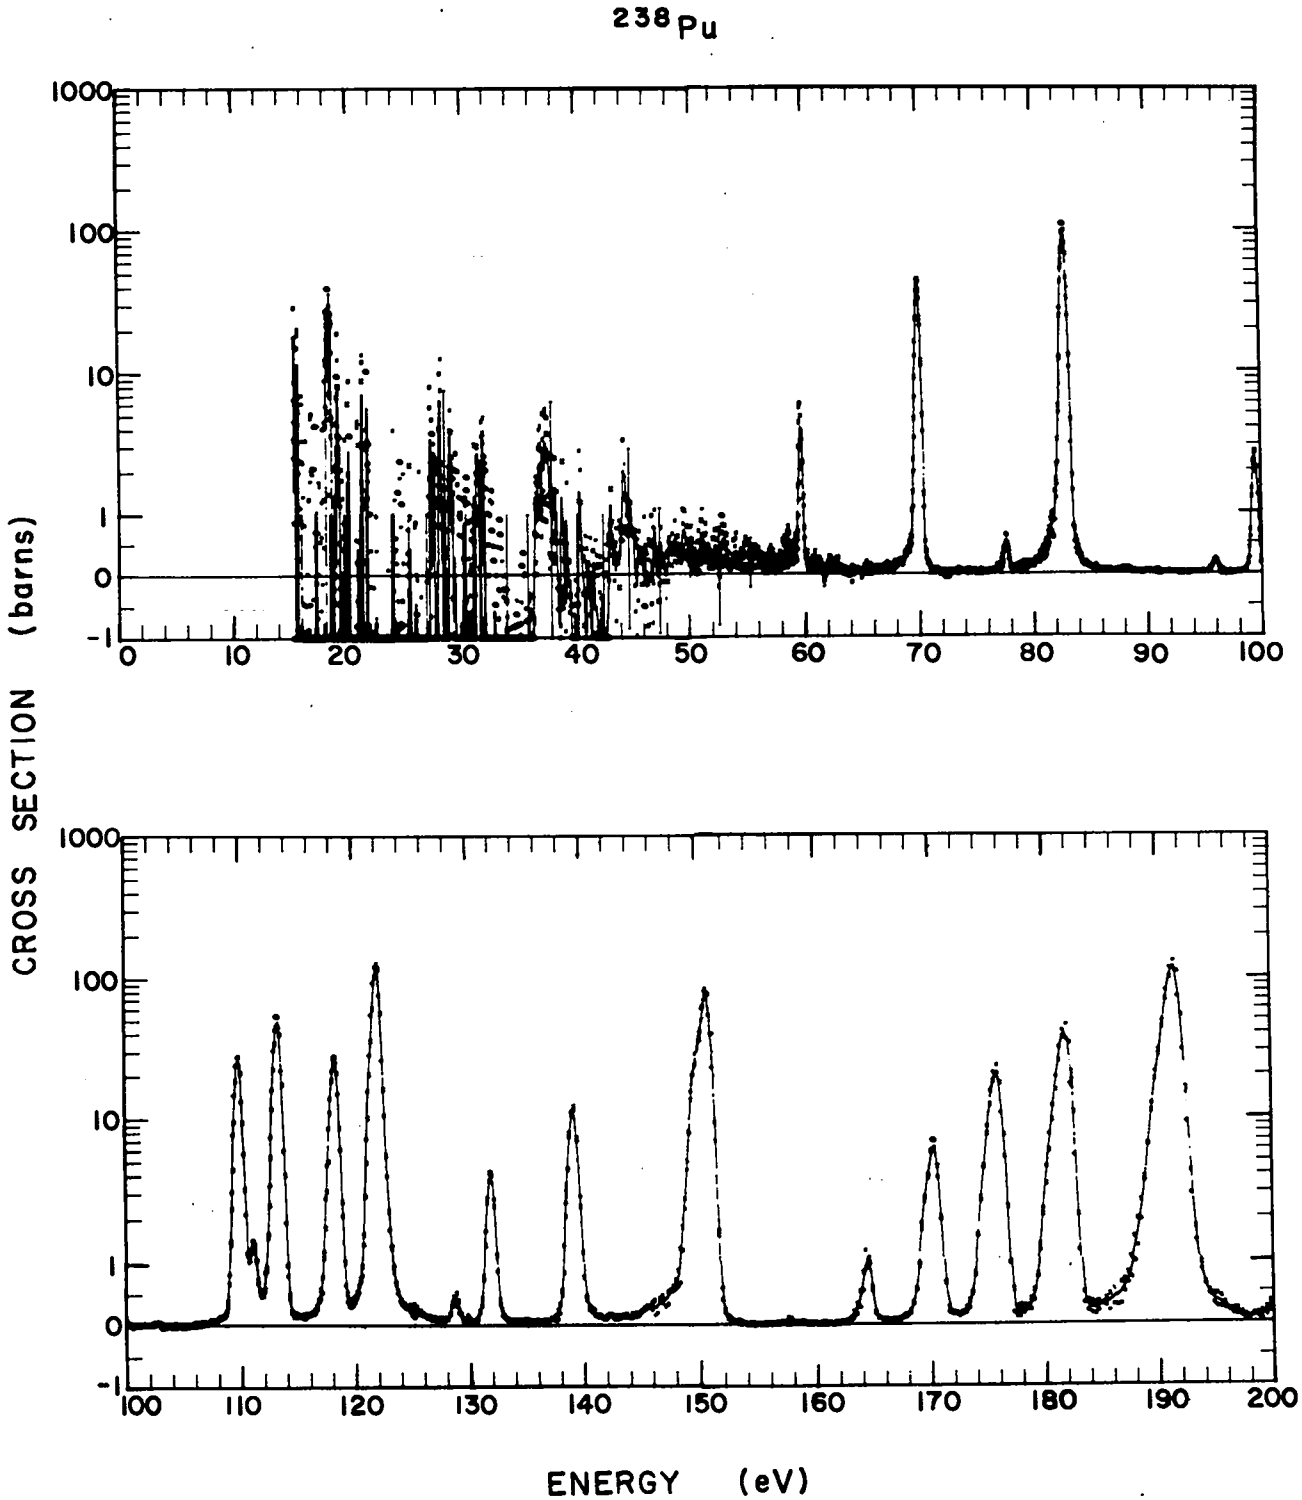

Fig. 15. Fission cross section of ^{238}Pu. Line is average of 55° (x) and 90° (*).

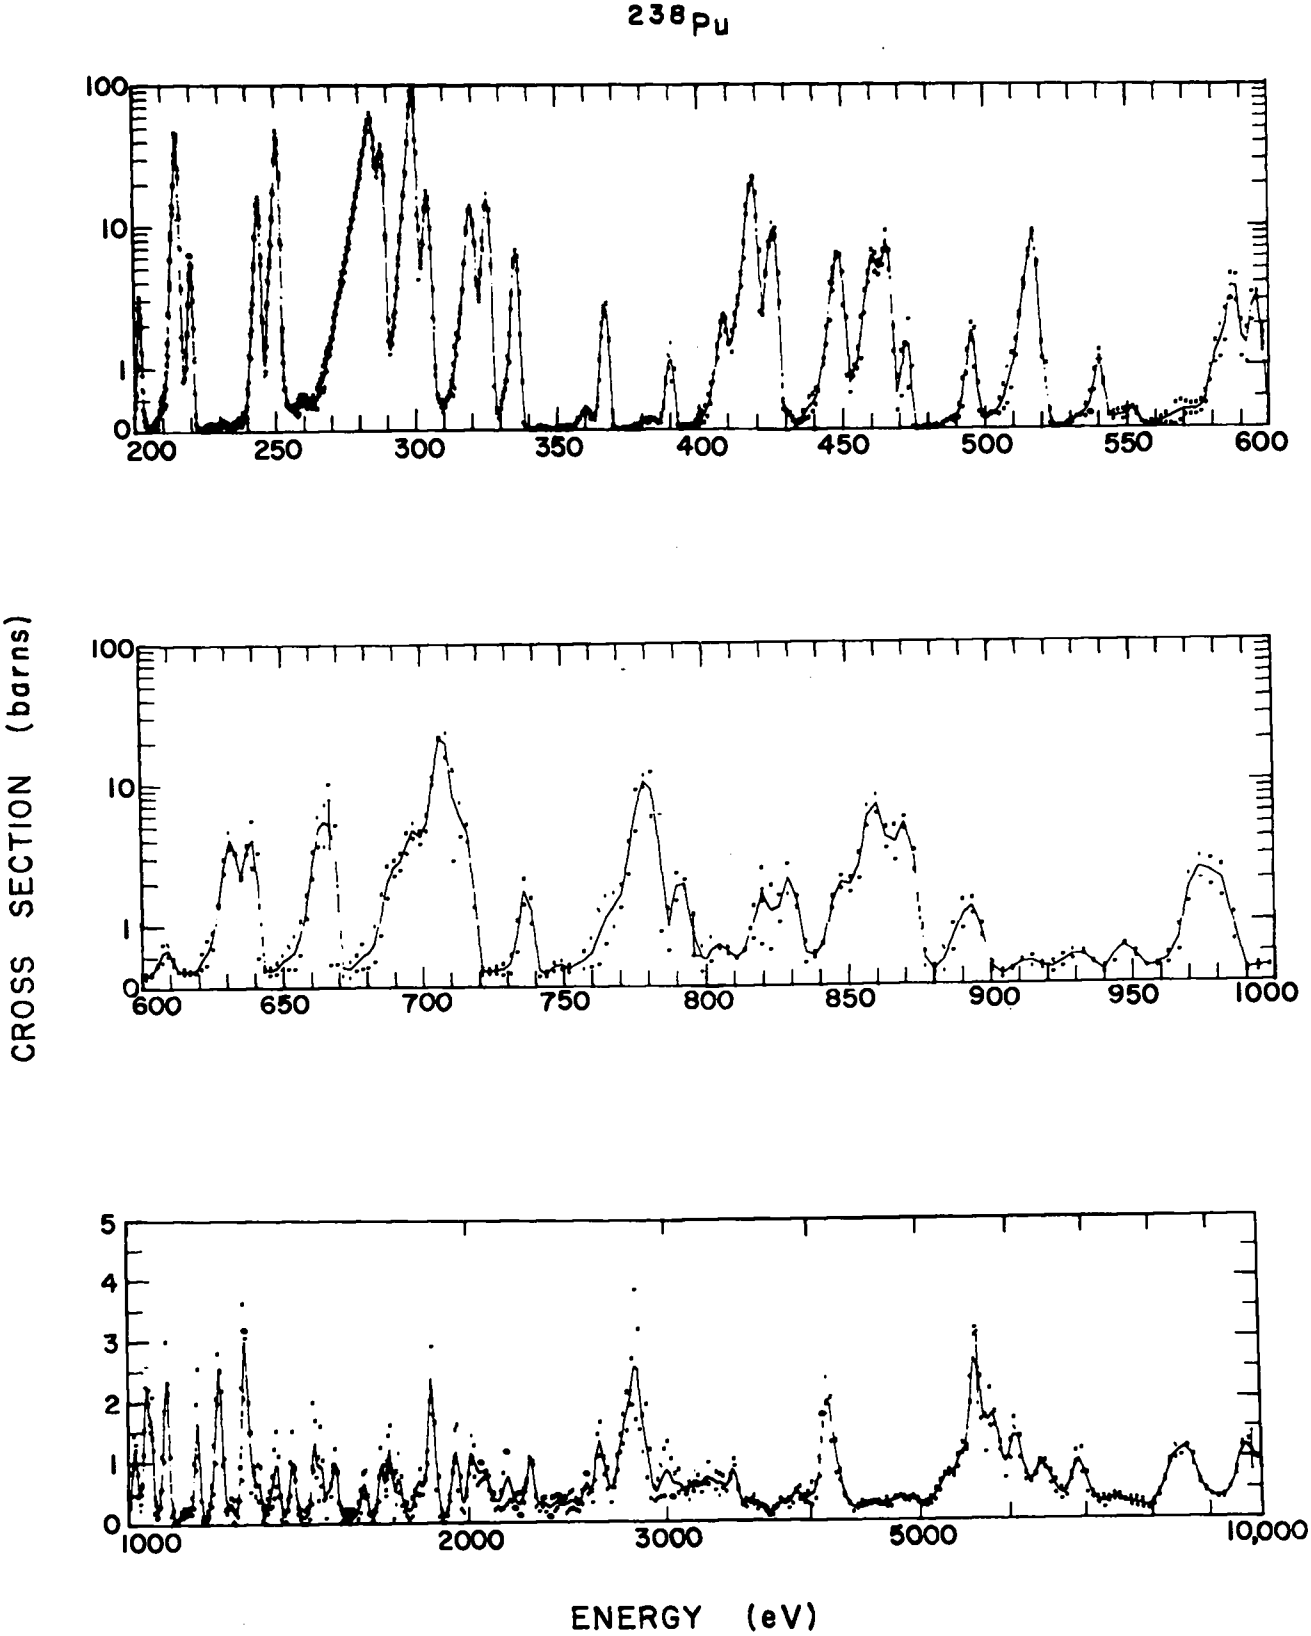

Fig. 16. Fission cross section of ^{238}Pu. Line is average of 55^{o} (x) and 90^{o} (*).

TABLE VIII

FISSION CROSS SECTION OF ^{238}PU (D. M. DRAKE, C. D. BOWMAN, M. S. COOPS, AND R. W. HOFF[13])

VIII. ^{242}Pu: D. W. Bergen and R. R. Fullwood[14]

In Fig. 17, the line is the smooth average of the 55° (x) and 90° (*) data. The target sample contained 0.02% ^{239}Pu and 0.09% ^{241}Pu, for which the data for ^{239}Pu[15] and ^{241}Pu[16] from the Petrel event have been used to make corrections. Figure 18 shows the data (x, average of two readings each of 55 and 90° data), the ^{241}Pu subtraction (*), the ^{239}Pu subtraction (+), and the result as a line. From 200 eV to 5 keV (Fig. 19), the subtraction has not been done: it is not very significant and is less exact because the resolution functions are different for the two shots. The data are given in Table IX in which the standard deviations $\delta\sigma/\sigma$ include the correlated error of ±5.7% above 100 keV and ±4.3% below 5 keV.

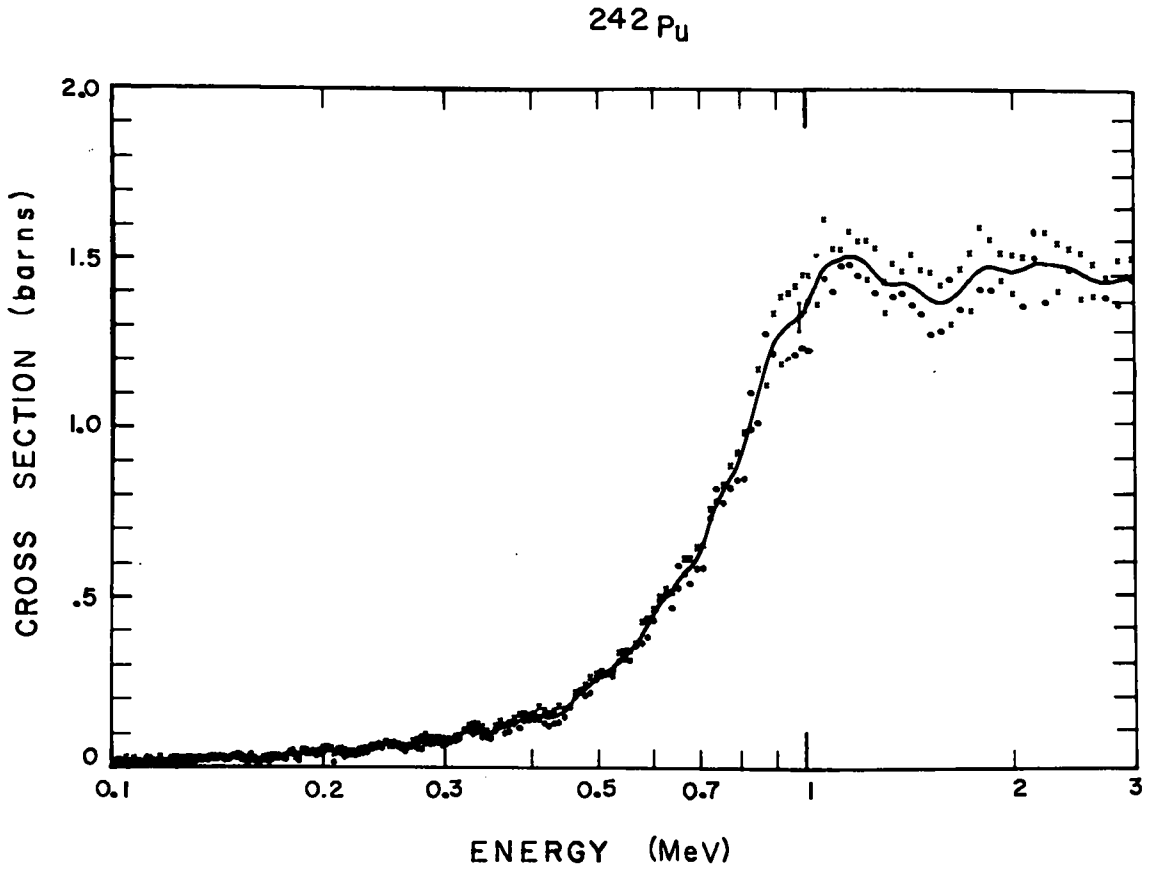

Fig. 17. Fission cross section of ^{242}Pu. The line is a Gaussian-smoothed average of 55° (x) and 90° (*) data.

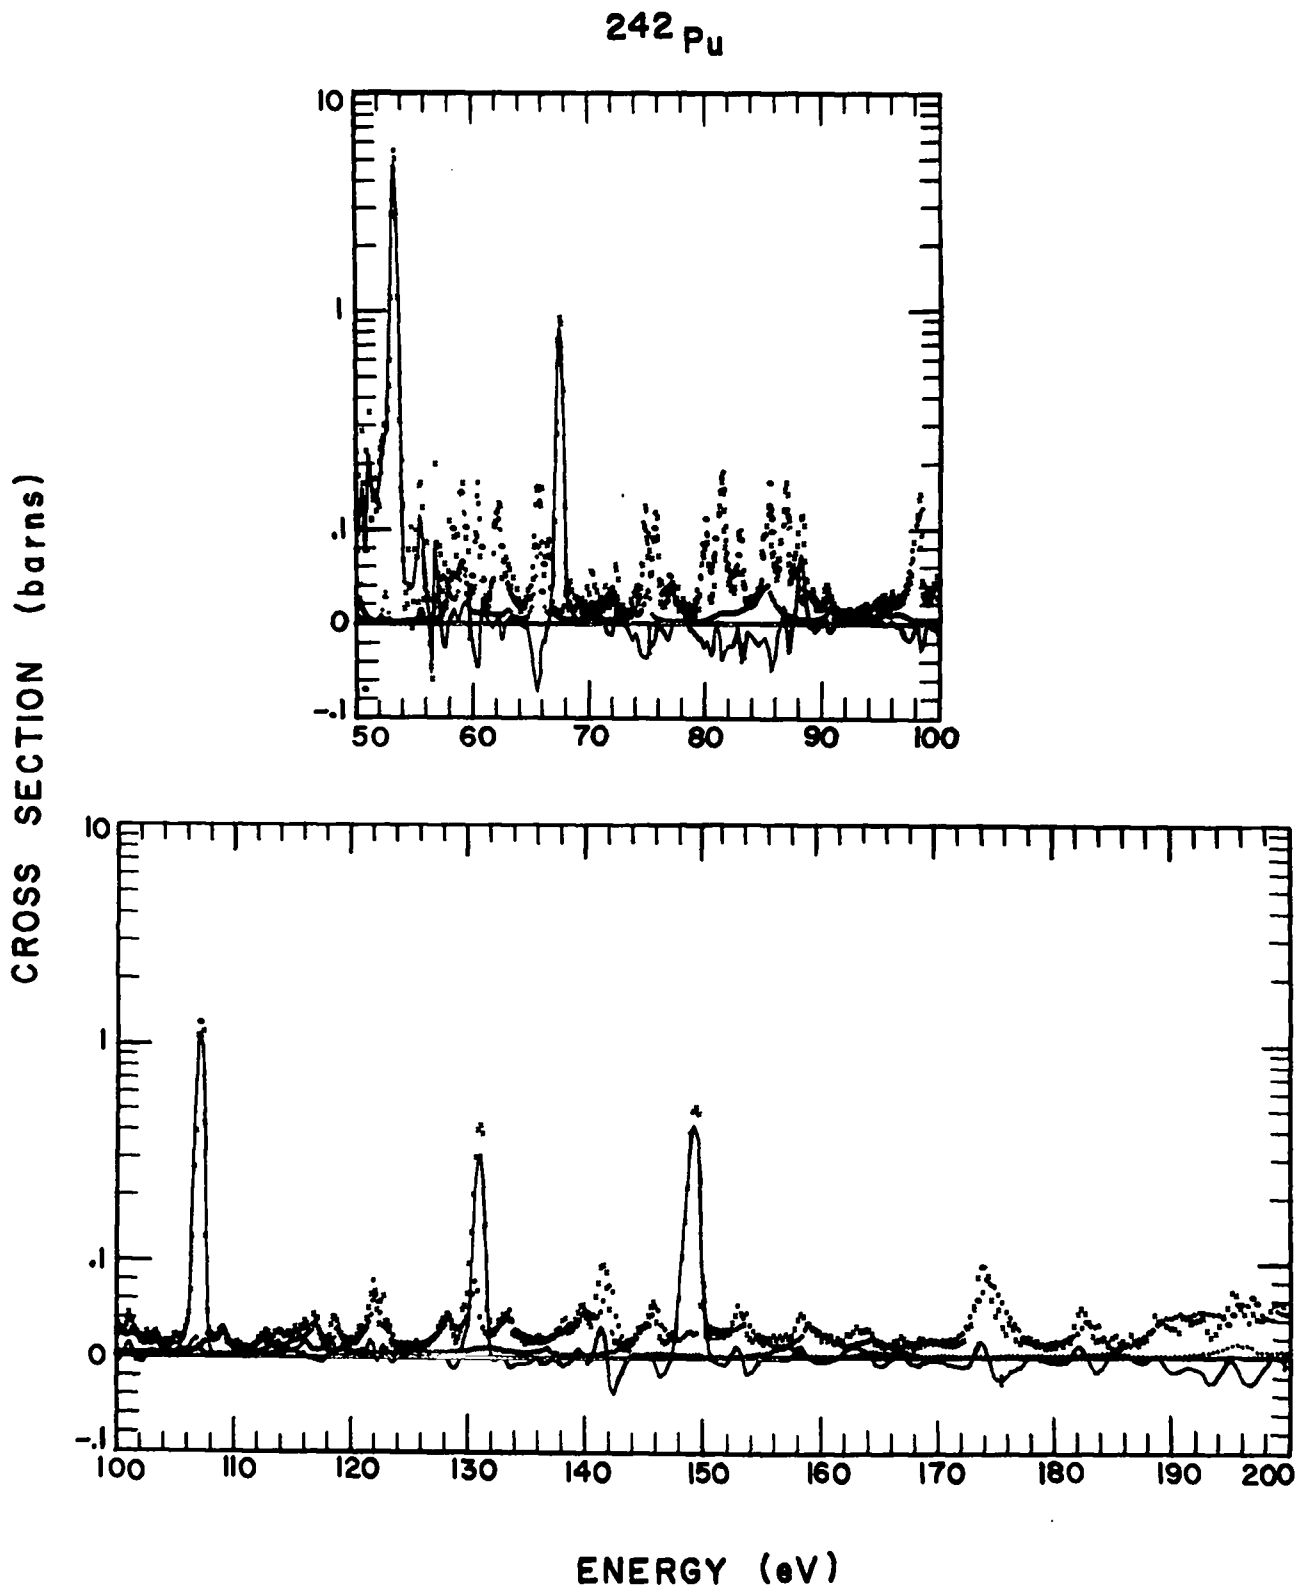

Fig. 18. Fission cross section of ^{242}Pu. Raw data (x) with amounts of ^{239}Pu (+) and ^{241}Pu (*) cross sections subtracted.

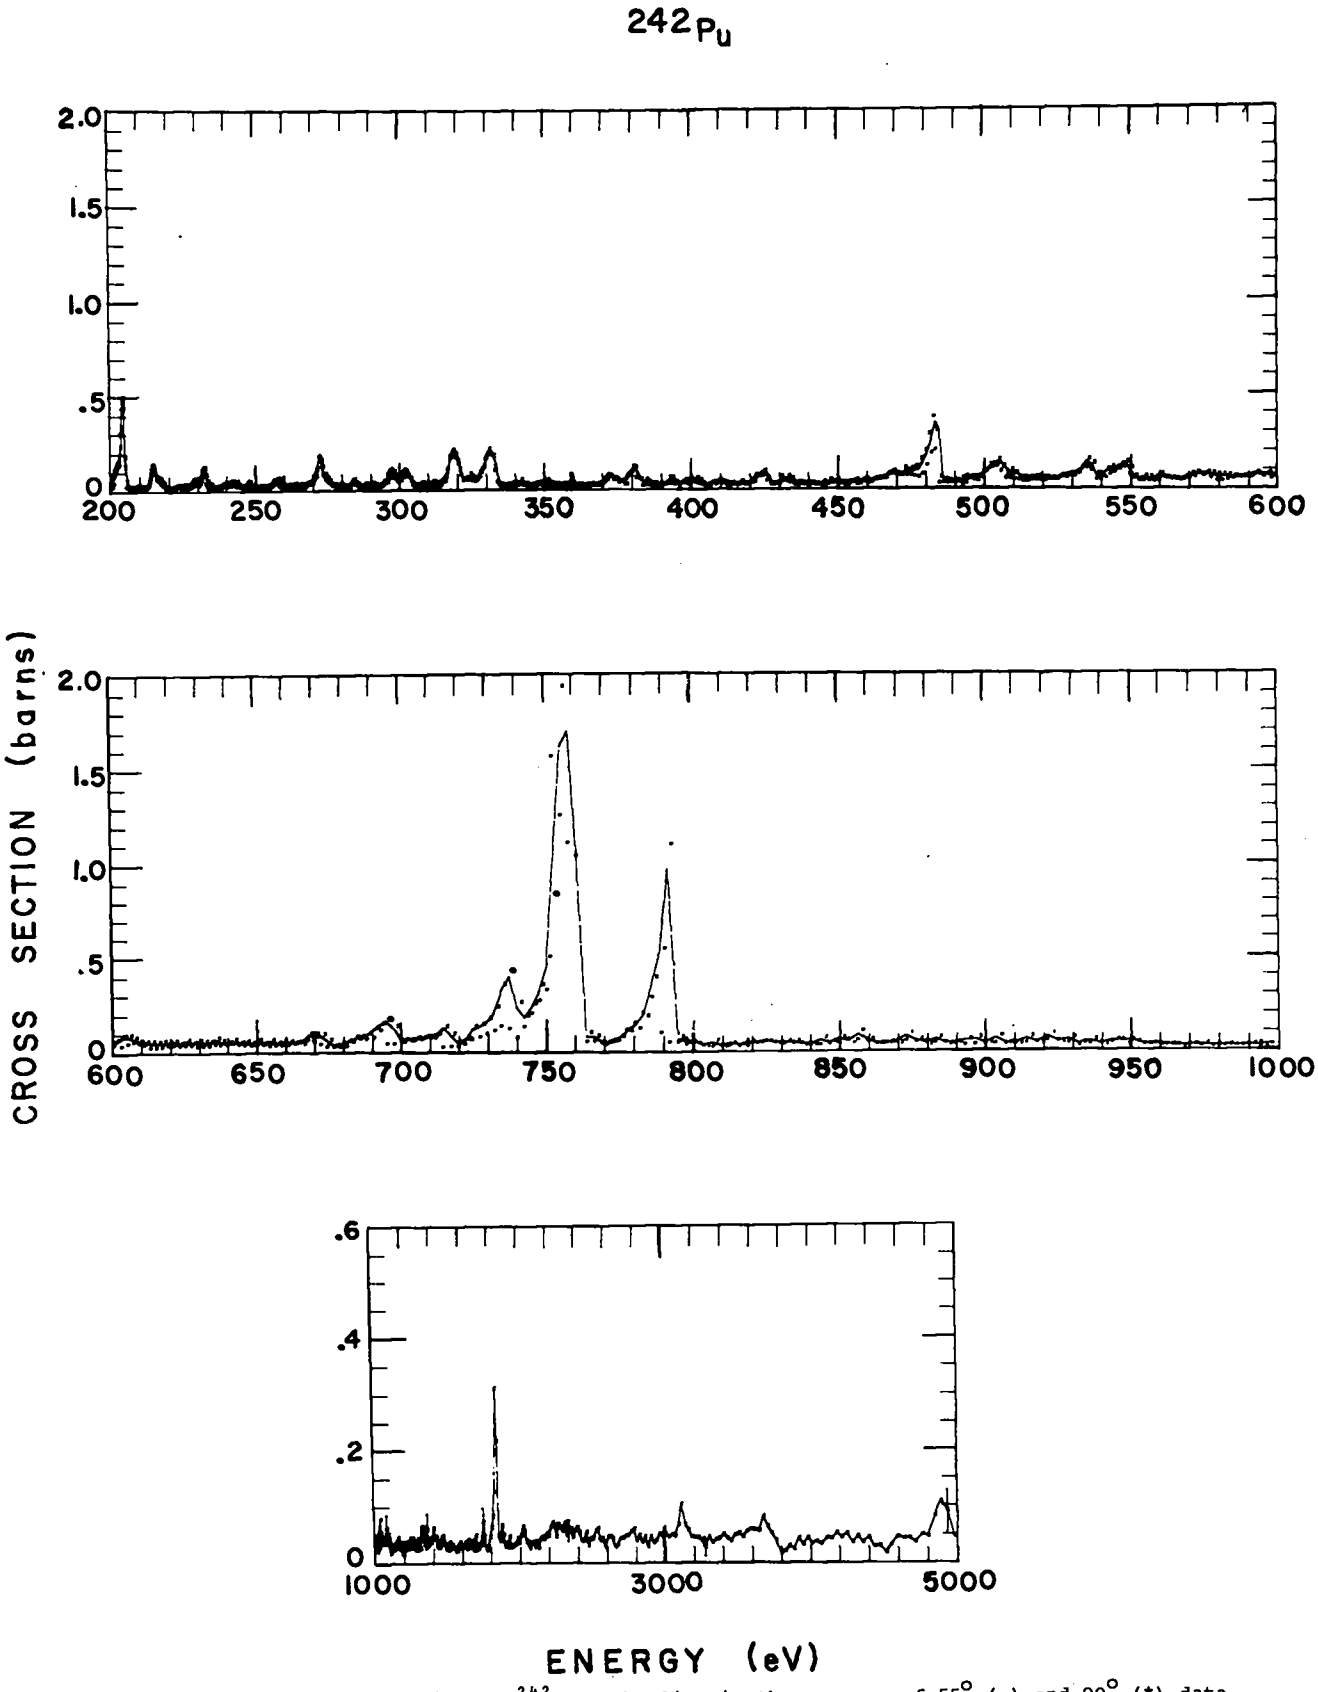

Fig. 19. Fission cross section of ^{242}Pu. The line is the average of 55° (x) and 90° (*) data.

TABLE IX

FISSION CROSS SECTION OF ^{242}PU (D. W. BERGEN AND R. R. FULLWOOD[14])

IX. ^{243}Am: P. A. Seeger[17]

The high-resolution, high-energy data are shown in Fig. 20 where the line is a smooth curve through the average. In Figs. 21 and 22 are plotted the average of two readings of the 55° (x) and 90° (*) signals, with a line connecting the points of the overall average. The 90° amplifier was slow recovering after the catastrophe and could not be used above 900 eV. The data are given in Table X. Correlated error (included in $\delta\sigma/\sigma$) is ±5.8% above 100 keV, ±5.0% from 10 keV to 900 eV, and ±4.4% below 900 eV.

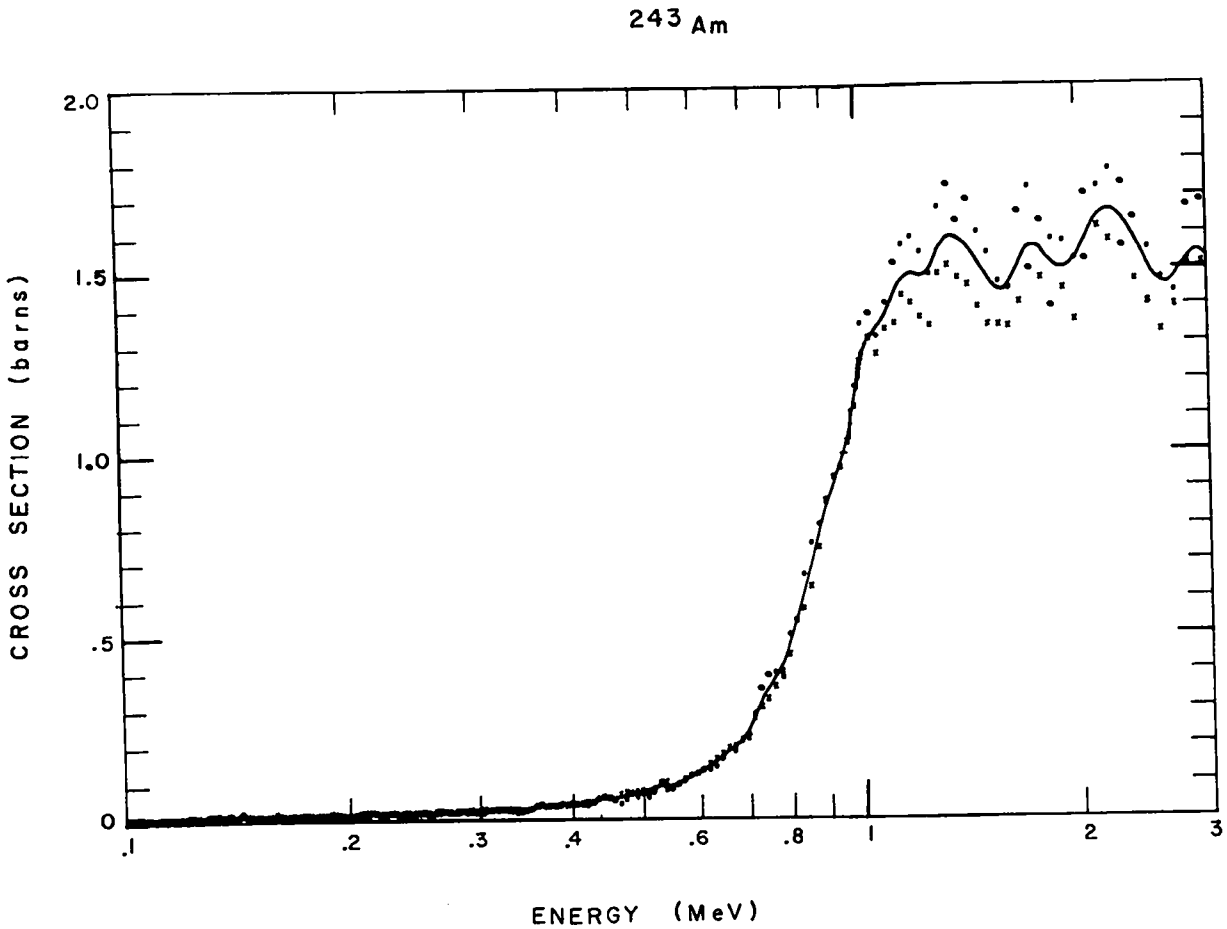

Fig. 20. Fission cross section of ^{243}Am. Gaussian-smoothed average of 55° (x) and 90° (*) data.

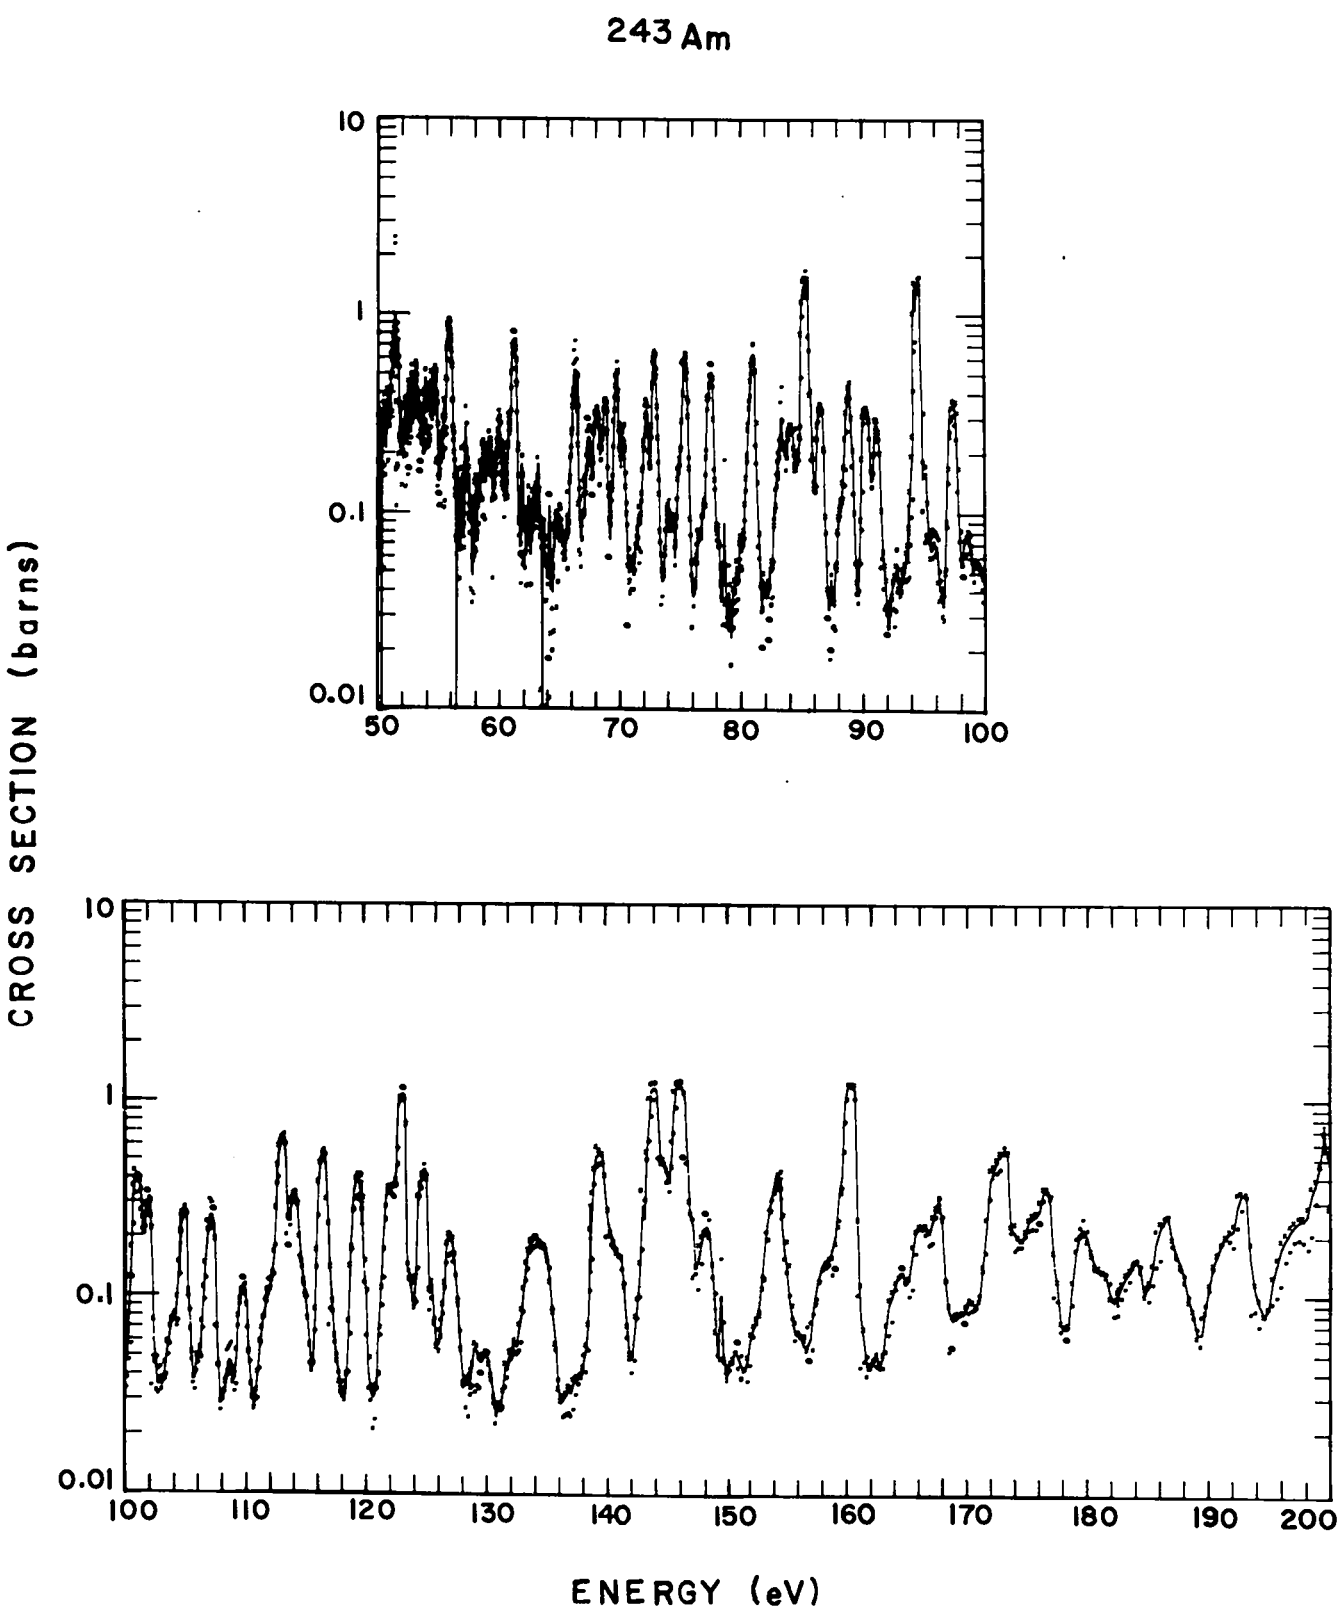

Fig. 21. Fission cross section of ^{243}Am. Average of 55° (x) and 90° (*) signals.

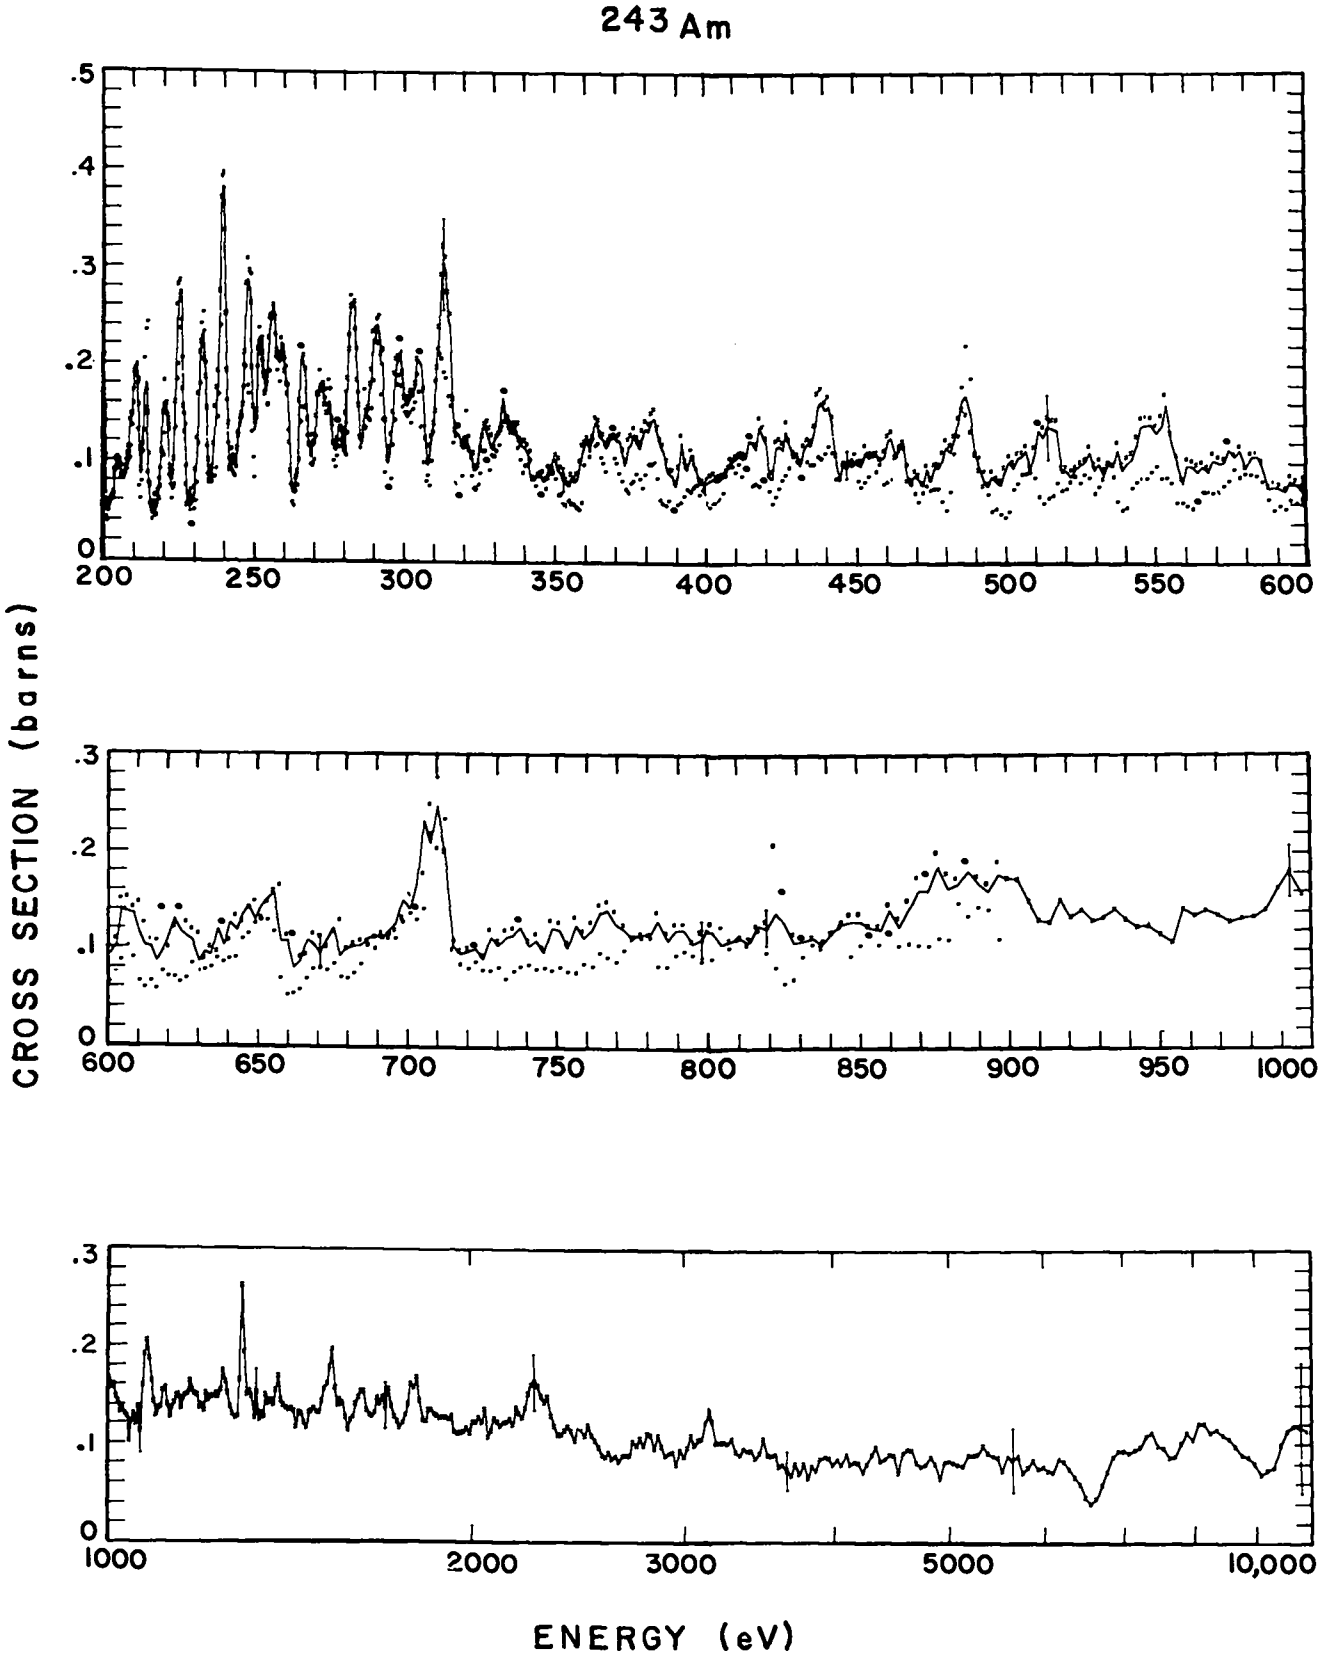

Fig. 22. Fission cross section of ^{243}Am. Average of 55° (x) and 90° (*) data; 55° only above 900 eV.

X. ^{243}Cm: R. R. Fullwood, D. R. Dixon, and R. W. Lougheed[18]

All of the usual recordings for this isotope were lost, but some data were recovered from single-sweep, plate-film recordings. The discrepancy between the two signals in Fig. 23 (x 90°, * 55°) is probably indicative of the recording uncertainties. The average data are given in Table XI; the correlated error is ±6.0%.

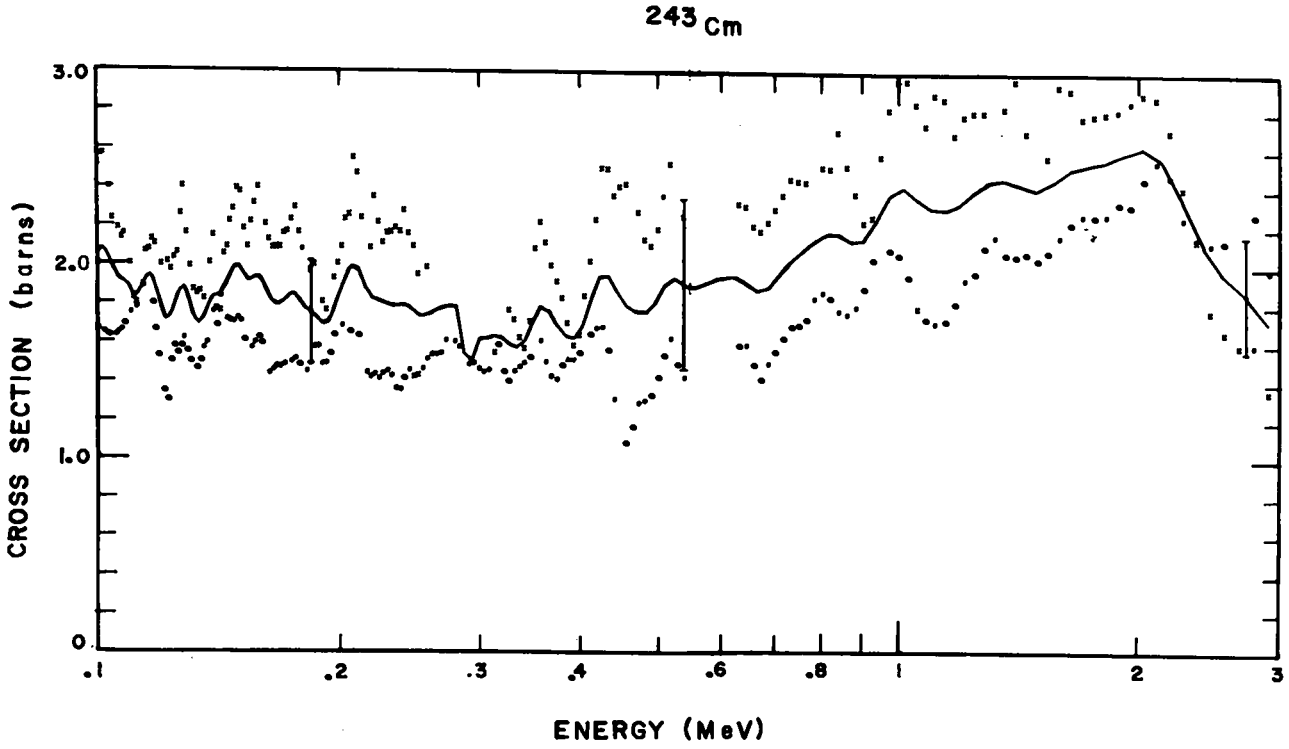

Fig. 23. Fission cross section of ^{243}Cm. Smoothed average of two poorly-recorded signals (x 90°, * 55°).

TABLE XI
